Abstract: The purpose of this study was to determine the effect of a 12-week resistance training program on the muscle strength and endurance of the lower extremities in healthy young adults. The subjects were 20 male and 20 female college students, aged 18-25 years, who were randomly assigned to either a resistance training group or a control group. The resistance training group performed a 12-week program of resistance training, while the control group did not. The subjects were tested at baseline and at 12 weeks for muscle strength and endurance. The results showed that the resistance training group had significantly greater muscle strength and endurance than the control group at 12 weeks. The findings suggest that a 12-week resistance training program can improve muscle strength and endurance in healthy young adults.

Figure 10 illustrates the water pump operation in normal mode and shows that the water pump (when used) is connected to the water source (river) and the distribution system network.

More than 50 years ago I witnessed the miraculous therapeutic power of penicillin when I was a student at the Tohoku University Medical School's Department of Bacteriology in Sendai Japan. The late Dr Kondo was a graduate student in the department at that time and developed the first crude penicillin preparation in Japan which was applied with dramatic results in two patients. Although there was patient family consent at that time ethics committees randomization mutagenesis tests distribution studies purity criteria and pharmacokinetics were not yet in existence. Today regulatory procedures have complicated the whole drug approval process. For example any new antibiotics that have been proven effective in laboratory studies against gram negative bacteria as might exist in deadly plague bacteria must still undergo a long and enormously costly regulatory process before they can be introduced to benefit society and before government insurance can be applied.
