Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were 40 sedentary, middle-aged women who were randomly assigned to either a supervised walking program or a control group. The walking program consisted of 12 weeks of supervised walking, 3 times per week, for 30 minutes per session. The control group consisted of 20 women who did not participate in the walking program. The physical health of the women was assessed using a variety of measures, including heart rate, blood pressure, and body mass index. The psychological health of the women was assessed using a variety of measures, including mood, self-esteem, and anxiety. The results of the study showed that the walking program had a positive effect on the physical and psychological health of the women. The women in the walking program had lower heart rates, lower blood pressures, and lower body mass indices than the women in the control group. The women in the walking program also had improved mood, self-esteem, and anxiety compared to the women in the control group. The results of this study suggest that a 12-week, low-intensity, supervised walking program can improve the physical and psychological health of sedentary, middle-aged women.

QUESTION A 60-year-old male with a 10-year history of type 2 diabetes mellitus presents with a 2-week history of blurred vision. He reports that his vision has been gradually worsening and is most noticeable when he looks at distant objects. He has no other symptoms, including no eye pain, redness, or discharge. His medical history is significant for hypertension, hyperlipidemia, and a recent diagnosis of peripheral artery disease. He is currently taking metformin, lisinopril, atorvastatin, and aspirin. His last HbA1c was 8.5% three months ago. He has no family history of eye disease. On physical examination, his visual acuity is 20/40 in both eyes. His intraocular pressures are 12 mmHg in both eyes. His fundus examination reveals bilateral, symmetric, fluffy white patches in the temporal periphery of the retina, consistent with cotton wool spots. There are no hemorrhages, exudates, or neovascularization visible. His optic discs appear normal. His refraction is -1.00 D in both eyes. His slit-lamp examination is unremarkable. What is the most likely cause of his blurred vision?

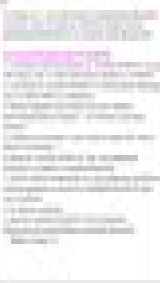

ANSWER A. Diabetic retinopathy
B. Hypertensive retinopathy
C. Ischemic optic neuropathy
D. Macular degeneration
E. Glaucoma

QUESTION
A 60-year-old male with a long history of smoking presents with a 2-week history of coughing up blood. He has lost weight and has had a persistent low-grade fever. He has no chest pain or shortness of breath. Physical examination is unremarkable. A chest X-ray shows a 3-cm nodule in the right upper lobe. A CT scan of the chest shows a 3-cm nodule in the right upper lobe with a spiculated margin. A PET scan shows increased uptake in the nodule. A biopsy of the nodule shows a poorly differentiated adenocarcinoma. What is the most likely histologic finding on the biopsy?

ANSWER
A. Glandular formation
B. Squamous nests
C. Keratin pearls
D. Mucin production
E. Necrosis

EXPLANATION
The patient's history and physical examination suggest a diagnosis of lung cancer. The chest X-ray and CT scan findings are consistent with a peripheral lung nodule. The PET scan finding of increased uptake in the nodule is also consistent with malignancy. The biopsy findings show a poorly differentiated adenocarcinoma, which is the most common type of lung cancer. The histologic findings of glandular formation, mucin production, and necrosis are characteristic of adenocarcinoma. Squamous nests and keratin pearls are characteristic of squamous cell carcinoma.
