

which is not even obvious in one dimension. It is not that the authors are shy of vectors as they were used extensively throughout the text. The only impulses which I could find were perpendicular to the plane of impact. Rough point masses rebounding off cricket bats were not considered.

Forces and the equilibrium of rigid bodies were discussed chapters before there was any mention of Newton's laws. This is the traditional thing, I believe, but not one to which I subscribe.

When Newton's Laws were eventually met there was a brave attempt at defining the inertial mass of a body. Well done, Sirs, but I don't think many of your readers would be all that interested. Newton's Second Law came out, predictably, as $F = ma$. As many of today's pupils are aware that mass can change with time I had expected some mention of rate of change of momentum. Newton's Third Law was clearly set out but I have yet to discover why it is supposed to be true for two bodies in collision. Perhaps someone can enlighten me.

Throughout the book there were references to experiments the results of which suggest the truth of certain hypotheses. It would have been nice to see some experimental data supporting them but this is, of course, a variation of the dreaded, "It can be shown that . . ."

In places the treatment is woolly. By all means go from the known to the unknown but beware of generalising from a simple example. Work is defined via mgh as force $\times$ distance on one page and, directly opposite, it becomes $\int F dx$ with no explanation as to the difference.

Moments of forces, without the vector cross product, almost had me tied in knots although it was obvious that the authors would have preferred to use it. They did pretty well and I congratulate them.

The book goes as far as the motion of a rigid body about a fixed axis and covers all the usual stuff about projectiles, simple harmonic motion, centres of mass and moments of inertia very well.

This is a book to read, a book to buy and a book to use. I hope you like it.

Further mechanics and probability, by L. Bostock and S. Chandler. Pp 467. £6.95. 1985. ISBN 0-85950-142-6 (Stanley Thornes)

Further mechanics and probability completes a set of four books designed to cover the work needed for Advanced level courses either in Mathematics and Further Mathematics or in Pure Mathematics and Applied Mathematics. It is a continuation of the work covered in the mechanics and probability book. An encouraging feature is the use of vectors. The first three chapters deal with scalar and vector products and relate these concepts to the vector equation of a curve, radial and transverse components of velocity and acceleration, power and work done by a variable force, and vector moment of a force and a couple. There are good chapters on oblique impact, projectiles on an inclined plane and on damped and forced harmonic motion. The book is strong on rotation with five chapters provided on rigid body dynamics. Two interesting chapters are provided on differential equations and on shearing force and bending moments. The probability section includes discrete and continuous variables together with the Poisson and normal distributions. There is a plentiful supply of examples, exercises and questions from all the examining boards. Multiple choice exercises are available.

This is an excellent publication and it will be most valuable for the teaching of double mathematics courses and for preparation for University entrance examinations. It overcomes the weaknesses of previous books which have never fully covered the syllabuses for Further Mathematics and Applied Mathematics. Teachers of sixth form students in schools and colleges will openly welcome this book.
