Apple Watch Radiation:

Nuclear Disaster at Fukushima Daiichi Richard Hindmarsh, 2013-08-21 Nuclear Disaster at Fukushima Daiichi is a timely and groundbreaking account of the disturbing landscape of the Fukushima Daiichi nuclear meltdown amidst an earthquake and tsunami on Japan's northeast coastline on March 11 2011. It provides riveting insights into the social and political landscape of nuclear power development in Japan which significantly contributed to the disaster, the flawed disaster management options taken, and the political, technical, and social reactions as the accident unfolded. In doing so, it critically reflects on the implications for managing future nuclear disasters, for effective and responsible regulation, and for good governance of controversial science and technology or technoscience and for the future of nuclear power itself, both in Japan and internationally. Informed by a leading cast of international scholars in science, technology, and society studies, the book is at the forefront of discussing the Fukushima Daiichi disaster at the intersection of social, environmental, and energy security and good governance when such issues dominate global agendas for sustainable futures. Its powerful critique of the risks and hazards of nuclear energy alongside poor disaster management is an important counterbalance to the plans for nuclear build as central to sustainable energy in the face of climate change, increasing extreme weather events, and environmental problems, and diminishing fossil fuel, peak oil, and rising electricity costs. Adding significantly to the consideration and debate of these critical issues, the book will interest academics, policy makers, energy pundits, public interest organizations, citizens, and students engaged variously with Fukushima itself, disaster management, political science, environmental energy policy, and risk, public health, sociology, public participation, civil society, activism, new media, sustainability, and technology governance.

Electromagnetic Radiations Pruthi Prashant Kulkarni, Parikshit N. Mahalle, 2025-03-18 The book delivers an understanding of emission theory and its effects on different strata of life. It contains seven chapters including probable remedial measures and solutions to increase reduced radiation life expectancy. The text explains important topics such as the compatibility of the human body and wireless communication applications and effectiveness of radiating power, energy harvesting, green energy solutions, and the human nervous system. This book discusses topics related to radiation and electromagnetic emissions, including their sources, effects, and ways to reduce exposure. It covers various aspects of the impact of electromagnetic fields on health and the environment, including measurement and modeling techniques, exposure assessment, and health effects. It explains electromagnetic emissions and their applications, as well as the impact of radiation on living organisms, including flora, fauna, and human beings. It provides a detailed analysis of the effects of radiation on animal and plant life. It highlights the potential benefits of electromagnetic emissions and provides information on how to mitigate the negative effects of radiation. It is primarily written for senior undergraduate, graduate students, and academic researchers in the fields including electrical engineering, electronics, communications engineering, and physics.

Introduction to Megavoltage X-Ray Dose Computation Algorithms Jerry Battista,2019-01-04 Read an exclusive interview with Dr Jerry Battista here A critical element of radiation treatment planning for cancer is the accurate prediction and delivery of a tailored radiation dose distribution inside the patient Megavoltage x ray beams are aimed at the tumour while collateral damage to nearby healthy tissue and organs is minimized The key to optimal treatment therefore lies in adopting a trustworthy three dimensional 3D dose computation algorithm which simulates the passage of both primary and secondary radiation throughout the exposed tissue Edited by an award winning university educator and pioneer in the field of voxel based radiation dose computation this book explores the physics and mathematics that underlie algorithms encountered in contemporary radiation oncology It is an invaluable reference for clinical physicists who commission develop or test

treatment planning software This book also covers a core topic in the syllabus for educating graduate students and residents entering the field of clinical physics This book starts with a historical perspective gradually building up to the three most important algorithms used for today's clinical applications These algorithms can solve the same general radiation transport problem from three vantages firstly applying convolution superposition principles i e Green's method secondly the stochastic simulation of radiation particle interactions with tissue atoms i e the Monte Carlo method and thirdly the deterministic solution of the fundamental equations for radiation fields of x rays and their secondary particles i e the Boltzmann method It contains clear original illustrations of key concepts and quantities throughout supplemented by metaphors and analogies to facilitate comprehension and retention of knowledge Features Edited by an authority in the field enhanced with chapter contributions from physicists with clinical experience in the fields of computational dosimetry and dose optimization Contains examples of test phantom results and clinical cases illustrating pitfalls to avoid in clinical applications to radiation oncology Introduces four dimensional 4D dose computation on line dose reconstruction and dose accumulation that accounts for tissue displacements and motion throughout a course of radiation therapy
