Advanced Transport Systems Analysis Modeling And Evaluation Of Performances:

Advanced Transport Systems Milan Janić, 2014-01-11 This book provides a systematic analysis modeling and evaluation of the performance of advanced transport systems. It offers an innovative approach by presenting a multidimensional examination of the performance of advanced transport systems and transport modes useful for both theoretical and practical purposes. Advanced transport systems for the twenty-first century are characterized by the superiority of one or several of their infrastructural, technical, technological, operational, economic, environmental, social, and policy performances as compared to their conventional counterparts. The advanced transport systems considered include Bus Rapid Transit (BRT) and Personal Rapid Transit (PRT) systems in urban areas; electric and fuel cell passenger cars; high-speed tilting trains; High-Speed Rail (HSR); TransRapid; Maglev (TRM); Evacuated Tube Transport system (ETT); advanced commercial subsonic and Supersonic Transport Aircraft (STA) conventionally and Liquid Hydrogen (LH2) fuelled commercial air transportation; advanced Air Traffic Control (ATC) technologies and procedures for increasing the airport runway capacity; Underground Freight Transport (UFT) systems in urban areas; Long Intermodal Freight Trains (LIFTs); road mega-trucks; large advanced container ships and freight cargo aircraft; and advanced freight goods collection/distribution networks. This book is intended for postgraduates, researchers, professionals, and policy makers working in the transport industry.

System Analysis and Modelling in Air Transport Milan Janić, 2021-01-04 This book presents a comprehensive analysis and modelling of demand, capacity, quality of services, economics, and sustainability of the air transport system and its main components: airports, airlines, and ATC/ATM (Air Traffic Control/Management). Airports consist of the airside and landside area characterized by their capacities for handling demand such as aircraft, air passengers, and air freight cargo shipments. Regarding spatial configuration, airlines generally operate hub and spoke, conventional or legacy airlines, and point-to-point (LCCs) Low-Cost Carriers air route networks. Their fleets, consisting of different aircraft types, provide transport capacity for serving demand including air passengers and freight cargo shipments. The ATC/ATM includes the controlled airspace, traffic management, and control facilities and equipment on the ground, space, and on-board aircraft, and the ATC Controllers. They all provide capacity to handle demand consisting of the flights between origin and destination airports carried out by airline aircraft. The outcome from the interrelationships between demand and capacity at these components materializes as the quality of services. At airports and airlines, this is generally expressed by congestion and delays of aircraft, air passengers, and freight cargo shipments. At ATC/ATM, this is expressed by delays, horizontal and vertical, in efficiency and safety of flights. Economics of each component relate to its revenues, costs, and profits from handling demand, i.e., providing services of given quality. The sustainability of air transport system has become an increasingly important issue for many internal and external actors/stakeholders involved to deal with. This has implied increasing the system's overall social/economic effects/benefits while reducing or maintaining constant impacts/costs on the environment and society at both global and regional/local scale under conditions of continuous, medium to long
