Feature Extraction

Feature Filtering

It's often a good idea to remove features that are not useful for the model. This can be done by removing features that are not correlated with the target variable.

One of the most common ways to filter features is by using the `select_dtypes` method. This method allows you to select features based on their data type. For example, you can select all features that are of type `int` or `float`.

```
df = df.select_dtypes(include=[int, float])
```

This will remove any features that are of type `object` or `category`. You can also use the `dropna` method to remove features that have missing values.

```
df = df.dropna()
```

This will remove any rows that have missing values in any of the features.
