Mathematics curriculum which is often a focus in education reforms has not received extensive research attention until recently. Ongoing mathematics curriculum changes in many education systems call for further research and sharing of effective curriculum policies and practices that can help lead to the improvement of school education. This book provides a unique international perspective on diverse curriculum issues and practices in different education systems, offering a comprehensive picture of various stages along curriculum transformation from the intended to the achieved and showing how curriculum changes in various stages contribute to mathematics teaching and learning in different educational systems and cultural contexts. The book is organized to help readers learn not only from reading individual chapters but also from reading across chapters and sections to explore broader themes including:

- Identifying what is important in mathematics for teaching and learning in different education systems
- Understanding mathematics curriculum and its changes that are valued over time in different education systems
- Identifying and analyzing effective curriculum practices
- Probing effective infrastructure for curriculum development and implementation

Mathematics Curriculum in School Education brings new insights into curriculum policies and practices to the international community of mathematics education with 29 chapters and four section prefaces contributed by 56 scholars from 14 different education systems. This rich collection is indispensable reading for mathematics educators, researchers, curriculum developers, and graduate students interested in learning about recent curriculum development research and practices in different education systems. It will help readers to reflect on curriculum policies and practices in their own education systems and also inspire them to identify and further explore new areas of curriculum research for improving mathematics teaching and learning.

Comparison and Oscillation Theory of Linear Differential Equations by C A Swanson, 2000-04-01

In this book we study theoretical and practical aspects of computing methods for mathematical modelling of nonlinear systems. A number of computing techniques are considered such as methods of operator approximation with any given accuracy, operator interpolation techniques including a non-Lagrange interpolation method of system representation subject to constraints associated with concepts of causality, memory, and stationarity, methods of system representation with an accuracy that is the best within a given class of models, methods of covariance matrix estimation, methods for low rank matrix approximations, hybrid methods based on a combination of iterative procedures and best operator approximation, and methods for information compression and filtering under condition that a filter model should satisfy restrictions associated with causality and different types of memory. As a result, the book represents a blend of new methods in general computational analysis and specific but also generic techniques for study of systems theory and its particular branches such as optimal filtering and information compression. Inman, 2006-11-02 Engineers are becoming increasingly aware of the problems caused by vibration in engineering design particularly in the areas of structural health monitoring and smart structures Vibration is a constant problem as it can impair performance and lead to fatigue damage and the failure of a structure Control of vibration is a key factor in preventing such detrimental results This book presents a homogenous treatment of vibration by including those factors from control that are relevant to modern vibration analysis design and measurement Vibration and control are established on a firm mathematical basis and the disciplines of vibration control linear algebra matrix computations and applied functional analysis are connected Key Features Assimilates the discipline of contemporary structural vibration with active control Introduces the use of Matlab into the solution of vibration and vibration control problems Provides a unique blend of practical and theoretical developments Contains examples and problems along with a solutions manual and power point presentations Vibration with Control is an essential text for practitioners researchers and graduate students as it can be used as a reference text for its complex chapters and topics or in a tutorial setting for those improving their knowledge of vibration and learning about control for the first time Whether or not you are familiar with vibration and control this book is an excellent introduction to this emerging and increasingly important engineering discipline
