Advanced Generation Systems Ibrahim Dincer:

Advanced Power Generation Systems Ibrahim Dincer, Calin Zamfirescu, 2014-07-15 Advanced Power Generation Systems examines the full range of advanced multiple output thermodynamic cycles that can enable more sustainable and efficient power production from traditional methods as well as driving the significant gains available from renewable sources. These advanced cycles can harness the by products of one power generation effort such as electricity production to simultaneously create additional energy outputs such as heat or refrigeration. Gas turbine based and industrial waste heat recovery based combined cogeneration and trigeneration cycles are considered in depth along with Syngas combustion engines, hybrid SOFC gas turbine engines and other thermodynamically efficient and environmentally conscious generation technologies. The uses of solar power, biomass, hydrogen and fuel cells in advanced power generation are considered within both hybrid and dedicated systems. The detailed energy and exergy analysis of each type of system provided by globally recognized author Dr Ibrahim Dincer will inform effective and efficient design choices while emphasizing the pivotal role of new methodologies and models for performance assessment of existing systems. This unique resource gathers information from thermodynamics, fluid mechanics, heat transfer and energy system design to provide a single source guide to solving practical power engineering problems. The only complete source of info on the whole array of multiple output thermodynamic cycles covering all the design options for environmentally conscious combined production of electric power, heat and refrigeration. Offers crucial instruction on realizing more efficiency in traditional power generation systems and on implementing renewable technologies including solar, hydrogen, fuel cells and biomass. Each cycle description clarified through schematic diagrams and linked to sustainable development scenarios through detailed energy, exergy and efficiency analyses. Case studies and examples demonstrate how novel systems and performance assessment methods function in practice.
