Recent studies have shown strong evidence of human activity impact on the climate of the planet Higher temperatures and intensification of extreme weather events such as hurricanes are among the consequences This scenario opens up several possibilities for what is now called green or low carbon economy We are talking about creating new businesses and industries geared to develop products and services with low consumption of natural resources and reduced greenhouse gases emission Within this category of business biofuels is a highlight and the central theme of this book The first section presents some research results for first generation ethanol production from starch and sugar raw materials Chapters in the second section present results on some efforts around the world to develop an efficient technology for producing second generation ethanol from different types of lignocellulosic materials While these production technologies are being developed different uses for ethanol could also be studied The chapter in the third section points to the use of hydrogen in fuel cells where this hydrogen could be produced from ethanol **Bioremediation and Sustainability** Romeela Mohee,Ackmez

Mudhoo,2012-04-02 Bioremediation and Sustainability is an up to date and comprehensive treatment of research and applications for some of the most important low cost green emerging technologies in chemical and environmental engineering Sustainable development requires the development and promotion of environmental management and a constant search for green technologies to treat a wide range of aquatic and terrestrial habitats contaminated by increasing anthropogenic activities with the main sources of contaminants being the chemical industries Bioremediation is a technique that uses living organisms in order to degrade or transform contaminants into their less toxic forms It is based on the existence of microorganisms with the capacity to attack the compounds on the enzymatic level Bioremediation is an increasingly popular low cost alternative to conventional methods for treating wastes and contaminated media with the possibility to degrade these contaminants using natural microbial activity mediated by different consortia of microbes Over the last few years the scientific literature has revealed the progressive emergence of various bioremediation techniques Bioremediation and Sustainability presents an up to date and comprehensive collection of chapters prepared in bioremediation technology research and applications The strategies covered in this volume can be applied in situ or ex situ depending on the site in which they will be applied In situ is the treatment done in the site of the contamination and ex situ involves the removal of soil or water to subsequent treatment There is a wide variety of techniques that have been developed in the past and are covered in this volume such as natural attenuation bioaugmentation biostimulation biosorption composting phytoremediation rhizoremediation and bioleaching **Microbiology of wetlands** Paul Bodelier,Svetlana N.

Dedysh,2013-07-08 Watersaturated soil and sediment ecosystems i e wetlands are ecologically as well as economically important systems due to their high productivity their nutrient re cycling capacities and their prominent contribution to global greenhouse gas emissions Being on the transition between terrestrial and aquatic ecosystems wetlands are buffers for terrestrial run off thereby preventing eutrophication of inland as well as coastal waters The close proximity of oxic anoxic conditions often created by wetland plant roots facilitates the simultaneous activity of aerobic as well as anaerobic microbial communities Input of nutrients and fast recycling due to active aerobes and anaerobes makes these systems highly productive and therefore attractive for humans as well as many other organisms Wetlands globally are under high pressure due to anthropogenic activities as well as climate change Changes of land use as well as altered hydrology due to climate change will lead to disturbance and loss of these habitats However the diversity and functioning of microbial communities in wetlands systems in highly underexplored in comparison to soils and aquatic ecosystems Given the importance of wetlands and their immediate threats combined with the lack of knowledge on the microbiology of these systems is the basis for this special issue focusing on the current microbiological knowledge and gaps therein to be assessed in future wetland research Papers research papers reviews perspectives opinion papers are welcomed that focus on all aspects that regulate the functioning and community composition of microbes i e bacteria archaea protozoa fungi in wetland ecosystems peat coastal as well as freshwater marshes flood plains rice paddies littoral zones of lakes etc from all geographic regions Welcomed topics are physiology ecology functioning biodiversity biogeography of microbes involved in nutrient cycling C N P Fe Mn green house gas emissions as well as plant microbe interactions These studies can be multidisciplinary and cover topics from the molecular to the community level
