

Transport in Plants

The phloem transports dissolved sugars to the rest of the plant from the leaves.

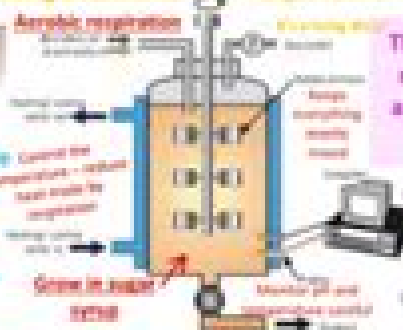

The xylem transports water and minerals up the plant from roots to leaves.

Water moves from the roots to the leaves, up the xylem via the **TRANSPIRATION STREAM**.

Plants also have a large surface area (provided by root hair cells) so they absorb most of the water and minerals a plant will need.

Sustainable Food
"producing food in a way that can continue for many years"

Using a fermenter:

The way we use the earth's resources can have long and short term effects on the environment.

But we can be better contributors about the environment should be checked to ensure it is a valid food before collected/converted. It is important to have experiments run for some time to check the results. This is much easier said than done!

to ensure we are not contributing to an impact

Energy lost as movement
Energy lost as heat

Adaptations for exchange in the intestines (absorbing your food)

Large surface area
Short diffusion pathway
Only one cell between blood and air in lungs
Good blood supply
Can take dissolved products of digestion - using diffusion and active transport to get it from the intestine to the blood

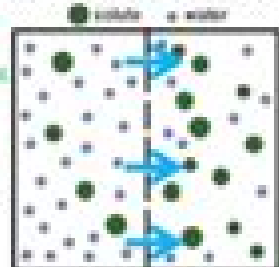

Energy Drinks - For when your DEHYDRATED

Contain: Water, sugar and mineral ions.
Water - to rehydrate
Sugar - for energy
Minerals - to replace those lost during sweating.

Osmosis

WATER diffusing from where it is a lot of it to where there is less of it.

Through a partially permeable membrane.

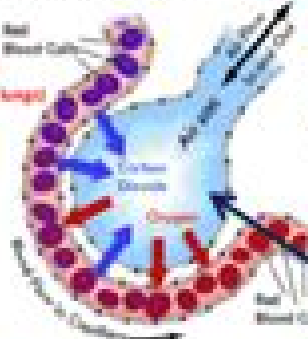

Remember: A concentrated substance usually contains less water.

Biology Unit 3

Adaptations for gaseous exchange (in your lungs)

Large surface area
Short diffusion pathway
Only one cell between blood and air in lungs
Steep concentration gradient.
Remember: a substance will move from where there's a lot to where there's a little.
This is helped with good blood supply and breathing in air (oxygen) and breathing out air (carbon dioxide).

Alveoli - Air sacs in the Lungs! You have loads of these wrapped in capillaries.

Lungs

Trachea (windpipe)

Ribs (protect your lungs)

Diaphragm

Breathing in (inhalation)

Diaphragm contracts flattens
Intercostal muscles (muscles around the ribs) contract - moving ribs up and out
Volume of lungs increases - air moves in

Breathing in (exhalation)

Diaphragm relaxes coming up
Intercostal muscles (muscles around the ribs) relax - moving ribs down and in
Volume of lungs decreases - air moves out

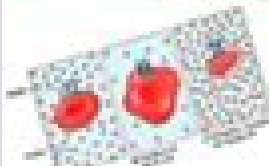

Active Transport

This is when some thing moves against the concentration gradient.
Low to High!

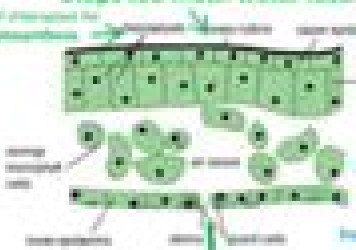

It needs energy to happen!
But means ions can be absorbed from soil and sugars and salts can move into cells.

Water moved up a plant stem from cell to cell by osmosis. Lots of water keeps the cell turgid.

Water moves in and out of cell depending on the concentration of the solution surrounding them.

Waxy cuticle - water and gas proof
Stops too much water loss.

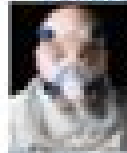

Water is lost more quickly when it's windy or hot
Water loss from the leaves is called **TRANSPIRATION**

Leaves are thin and flat giving them a large surface area for diffusion of gases (O₂ in and oxygen out).
Guard cells around stomata can open and close to let CO₂ in but stop too much water being lost!

Artificial breathing

Positive pressure - pushing the air in.

Benefits: Not invasive (just a mask), can aid the paralysed for years and can be used during surgery.
Can be used at home!

Negative pressure - a vacuum is created outside the body moving the chest up and causing air to be drawn in.

The Iron Lung

Benefits: Will keep you alive.
Drawbacks: Very restricting and out dated. Must stay in hospital (not really used anymore)
