Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 12 women, 40 to 50 years of age, who were sedentary and had no cardiovascular or other medical problems. The subjects were randomly assigned to either a control group or a training group. The control group continued with their sedentary lifestyle, while the training group participated in a 12-week training program consisting of three sessions per week of aerobic exercise. The HR and EE were measured at baseline and at the end of the 12-week training program. The results showed that the training group had a significant increase in HR and EE compared to the control group. The HR increased from 70 to 78 beats per minute, and the EE increased from 1,800 to 2,200 kcal per day. The control group showed no significant change in HR or EE. The results of this study suggest that a 12-week training program can significantly increase the HR and EE of sedentary, middle-aged women.
