Introduction

XTIDE Universal BIOS is mainly used with [XTIDE controller](#) to use modern IDE drives on PC/XT systems. XTIDE Universal BIOS supports 16- and 32-bit IDE controllers found in later ISA, VLB and PCI systems. Thus XTIDE Universal BIOS can be used to overcome 504 MiB hard disk size limit that many old BIOSes have.

Features

Some of the features included in XTIDE Universal BIOS are ... * Supports up to 5 IDE controllers (10 drives) * Accesses up to 8.4 GB hard disk space (BIOS CHS limit) * Block mode transfers * Hard disk autodetection * Autodetected CHS parameters can be overridden to make drive appear smaller than it is * Boot menu for selecting any floppy drive or hard disk to boot from, including hard disks that are not handled by XTIDE Universal BIOS * Compact Flash and Microdrive support * Support for most 8-, 16-, and 32-bit IDE controllers * IRQ and polling operation modes ...and many more.

Different builds

At the moment there are three different builds included in the XTIDE Universal BIOS zip file: * IDE_XT.BIN (XT build)

*XT build uses only instructions supported by 8086/8088 making it the only build that can be used on any PC, including the original IBM PC model 5150. * IDE_XTR.BIN (XT+ build) XT+ build has the same features as the XT build but XT+ build uses instructions introduced in 80186/80188. Those instructions are supported by all later x86 CPUs, including NEC V20/V30. 8-bit transfers rates will be better thanks to INS and OUTS instructions. * IDE_AT.BIN (AT build) AT build is meant for all AT class machines (16-bit or 32-bit bus). AT build supports OS hooks to allow operating system to do some processing while drive seeks the requested data. By default, the AT build is configured to full mode to take advantage of all the features the XTIDE Universal BIOS offers.*

Installing XTIDE Universal BIOS

Hardware supporting XTIDE Universal BIOS ROM

The most convenient way to use XTIDE Universal BIOS is to use [XTIDE card](#). It can be used on any PC with free 8-bit ISA slot. You might not want to connect any drives to it in 16- or 32-bit systems since 8-bit transfer will be very slow. Using XTIDE card allows EEPROM flashing so it is really easy to update XTIDE Universal BIOS.

Another option is to use any card with free ROM socket for 8 kiB or larger ROMs. Official XTIDE builds are meant for 8 kiB ROMs but you can burn it on larger ROM if you append enough zeroes to the end (only append zeroes so checksum does not change). Many network cards have unused ROM sockets but there are also few multi I/O cards and IDE controllers with ROM sockets.

You don't need EPROM/EEPROM programmer if you already have XTIDE card. XTIDE card can be used to flash additional EEPROMs (2864) that can be moved to EPROM (2764) sockets.

Configuring and flashing BIOS

XTIDE Universal BIOS comes with DOS utility called [idectg.com](#). It configures XTIDE Universal BIOS and also works as a generic EEPROM flasher supporting EEPROM sizes up to 16 kiB. Idectg.com allows saving changes to BIOS images so that they can be programmed with other programming software or device.

Other things to know

CTRL can be held down to skip XTIDE Universal BIOS initialization. Only drive detection will be skipped when late initialization is used.
