

Thermal effects play significant role in the design of a structure when it is supposed to work in hot environment. For this purpose a thorough analysis of structure is necessary that could precisely consider the effect of temperature change. At first an accurate thermal analysis is required that may be further followed by static or dynamic analysis. In this work, shell finite element developed by Aries et al. to perform 3D thermal analysis is studied using Aries and on the other hand found good when comparing with the 2D solid element result. The interlaminar shear stress analysis of composite plate considering thermal and mechanical loading is studied under different set up of laminate scheme and the results have been found good when compared with the available 3D elasticity results. Thus, the effect of thermal stresses on natural frequency of a structure is assigned considering as thermal prestress load under different laminate schemes and boundary conditions. Finally, A stringer stiffened panel is analysed under thermal and mechanical load. Interlaminar stresses and natural frequency are evaluated by considering the effect of thermal loading.
