Comparison and Oscillation Theory of Linear Differential Equations by C A Swanson, 2000-04-01

In this book we study theoretical and practical aspects of computing methods for mathematical modelling of nonlinear systems. A number of computing techniques are considered such as methods of operator approximation with any given accuracy, operator interpolation techniques including a non-Lagrange interpolation method of system representation subject to constraints associated with concepts of causality, memory, and stationarity, methods of system representation with an accuracy that is the best within a given class of models, methods of covariance matrix estimation, methods for low rank matrix approximations, hybrid methods based on a combination of iterative procedures and best operator approximation, and methods for information compression and filtering under condition that a filter model should satisfy restrictions associated with causality and different types of memory. As a result, the book represents a blend of new methods in general computational analysis and specific but also generic techniques for study of systems theory and its particular branches such as optimal filtering and information compression. Inman, 2006-11-02 Engineers are becoming increasingly aware of the problems caused by vibration in engineering design particularly in the areas of structural health monitoring and smart structures Vibration is a constant problem as it can impair performance and lead to fatigue damage and the failure of a structure Control of vibration is a key factor in preventing such detrimental results This book presents a homogenous treatment of vibration by including those factors from control that are relevant to modern vibration analysis design and measurement Vibration and control are established on a firm mathematical basis and the disciplines of vibration control linear algebra matrix computations and applied functional analysis are connected Key Features Assimilates the discipline of contemporary structural vibration with active control Introduces the use of Matlab into the solution of vibration and vibration control problems Provides a unique blend of practical and theoretical developments Contains examples and problems along with a solutions manual and power point presentations Vibration with Control is an essential text for practitioners researchers and graduate students as it can be used as a reference text for its complex chapters and topics or in a tutorial setting for those improving their knowledge of vibration and learning about control for the first time Whether or not you are familiar with vibration and control this book is an excellent introduction to this emerging and increasingly important engineering discipline **University of California Union Catalog of Monographs Cataloged by the Nine Campuses from 1963 Through 1967: Authors & titles** University of California (System).
