Mathematical and Physical Modeling of Materials Processing Operations Olusegun Johnso Ilegbusi, Manabu Iguchi, Walter E. Wahnsiedler, 1999-07-29 The past few decades have brought significant advances in the computational methods and in the experimental techniques used to study transport phenomena in materials processing operations. However, the advances have been made independently and with competition between the two approaches. Mathematical models are easier and less costly to implement but experiments are essential for verifying theoretical models. In *Mathematical and Physical Modeling of Materials Processing Operations*, the authors bridge the gap between mathematical modelers and experimentalists. They combine mathematical and physical modeling principles for materials processing operations simulation and use numerous examples to compare theoretical and experimental results. The modeling of transport processes is multidisciplinary involving concepts and principles not all of which can be associated with just one field of study. Therefore, the authors have taken care to ensure that the text is self-sustaining through the variety and breadth of topics covered. Beyond the usual topics associated with transport phenomena, the authors also include detailed discussion of numerical methods and implementation of process models, software and hardware selection and application, and representation of auxiliary relationships including turbulence modeling, chemical kinetics, magnetohydrodynamics, and multi-phase flow. They also provide several correlations for representing the boundary conditions of fluid flow, heat transfer, and mass transfer phenomena. *Mathematical and Physical Modeling of Materials Processing Operations* is ideal for introducing these tools to materials engineers and researchers. Although the book emphasizes materials, some of the topics will prove interesting and useful to researchers in other fields of chemical and mechanical engineering. **Mathematical Modelling and**

Applications Gloria Ann Stillman, Werner Blum, Gabriele Kaiser, 2017-11-05 This volume documents on-going research and theorising in the sub-field of mathematics education devoted to the teaching and learning of mathematical modelling and applications. Mathematical modelling provides a way of conceiving and resolving problems in the life-world of people, whether these range from the everyday individual numeracy level to sophisticated new problems for society at large. Mathematical modelling and real-world applications are considered as having potential for multi-disciplinary work that involves knowledge from a variety of communities of practice such as those in different workplaces, e.g. those of educators, designers, construction engineers, museum curators, and in different fields of academic endeavour, e.g. history, archaeology, mathematics, economics. From an educational perspective, researching the development of competency in real-world modelling involves research situated in crossing the boundaries between being a student engaged in modelling or mathematical application to real-world

tasks in the classroom being a teacher of mathematical modelling in or outside the classroom or bridging both and being a modeller of the world outside the classroom This is the focus of many of the authors of the chapters in this book All authors of this volume are members of the International Community of Teachers of Mathematical Modelling ICTMA the peak research body into researching the teaching and learning of mathematical modelling at all levels of education from the early years to tertiary education as well as in the workplace
