

Holography is a technique for creating three-dimensional photographs. Because these photographs were created without the use of a lens, the technique is also known as lensless photography. Holograms (Greek holos, "complete"; gram, "message") are the records. Dennis Gabor, a British physicist, invented the theoretical principles of holography in 1947. When the laser became available in the early 1960s, the first genuine fabrication of holograms took place. True-color holograms, as well as holograms extending from the microwave to the X-ray part of the spectrum, were conceivable by the late 1980s. Sound waves were also used to create ultrasonic holograms.

Holography is one of contemporary science and technology's most spectacular achievements. Holograms have the unique ability to restore high-quality volumetric images of real people. The word "holography" comes from the Greek words holos, which means "full record," and grapho, which means "write."

Holography is a photographic method that differs from a traditional image in that it registers not only intensity in a photosensitive substance, but also phase of light waves scattered by the object, carrying the whole information about the item's three-dimensional structure. Holograms have a unique quality as a medium for mapping reality: unlike a regular photograph, a holographic image may reproduce a perfect three-dimensional reproduction of the original object. Such an image with a variety of perspectives, which changes with changes in supervision, has incredible realism and frequently resembles a real thing. Unlike photography or painting, holography can accurately depict three-dimensional objects. Everything your eyes see – size, shape, texture, and relative position – may be created by a hologram. When you touch a holographic image, however, all you get is focused light.

Holography's history

Holography has been known since 1947, when British scientist Dennis Gabor (a native of Hungary) developed the theory of holography while attempting to improve the resolution of an electron microscope. Gabor invented the term holography, which comes from the Greek words holos, which means "whole," and gramma, which means "message." Because the light sources available at the time were not completely "coherent," more advancement in the field took place throughout the next period.

The invention of the laser, whose clean, bright light was excellent for generating holograms, by Russian scientists N. Bassov and A. Prokhorov and American scientist Charles Towns with
