

Comprehensive Guide to Airway, Breathing, and Circulatory Emergencies

Anatomy of the Airway

The airway anatomy is fundamental to understanding respiratory emergencies. The upper airway comprises the nasopharynx, oral cavity, uvula, laryngopharynx, and larynx. The cricoid cartilage is a critical structure—it is the only complete ring around the trachea, providing support and a landmark for airway procedures. The epiglottis plays a vital role during swallowing by closing over the trachea to prevent aspiration. The lower airway begins below the vocal cords and includes the trachea, which divides at the carina into the mainstem bronchi—the right mainstem bronchus aligns directly with the trachea, making it a common passageway for aspirated objects. The lungs are divided into lobes, with the right lung having three lobes and the left lung having two lobes.

Airway Management Techniques

Proper airway management is crucial for effective ventilation and oxygenation. The head tilt–chin lift maneuver is the standard technique to open the airway in non-trauma patients, applying heel pressure to tilt the head back and lifting the chin upward. However, if spinal injury is suspected, a jaw thrust maneuver with inline cervical spine stabilization is preferred to avoid exacerbating injury. The jaw thrust involves placing fingers behind the angle of the lower jaw and lifting it upward while maintaining inline stabilization of the cervical spine, often with a cervical collar.
