

An Introduction to Survival Analysis Using Stata, Third Edition provides new researchers with the foundation for understanding the various approaches for analyzing time-to-event data. This book serves not only as a tutorial for those wishing to learn survival analysis but also as a valuable reference for experienced researchers interested in using Stata to analyze survival data.

The book is written for professional researchers from all disciplines, including biostatistics, epidemiology, public health, medicine, sociology, economics, political science, engineering, and other fields where survival analysis is applicable. Although the book assumes knowledge of statistical principles, basic probability, and working knowledge of Stata, it is practical rather than mathematical in its approach to the subject. The reader of this book will come away not just with understanding of the formulas but also with intuition of how the various survival analysis estimators work and what information they exploit. The reader will also come away with deeper and more comprehensive knowledge of the syntax, features, and underpinnings of Stata's survival analysis routines.

The third edition has been updated to highlight the new features in Stata 11, in particular, competing-risks analysis and the treatment of missing values via multiple imputation. Among the other additions are new diagnostic measures after Cox regression, Stata's new treatment of categorical variables and interactions, and a new syntax for obtaining predictions and diagnostics after Cox regression.

The authors are also the authors of Stata statistical software, in particular, Stata's widely used survival analysis suite.

gradients OPG **An Introduction to Survival Analysis Using Stata** Mario Cleves, 2014 **Causal Analysis with Event History Data Using Stata** Hans-Peter Blossfeld, Götz Rohwer, Gwendolin J. Blossfeld, 2025-07-28

This third edition of *Causal Analysis with Event History Data Using Stata* provides an updated introduction to event history modeling along with many instructive Stata examples. Using the latest Stata software, each of these practical examples develops a research question, points to useful contextual background information, gives a brief account of the underlying statistical concepts, describes the organization of input data, and the application of Stata statistical procedures, and assists the reader in interpreting the content of the results obtained. Emphasizing the strengths and limitations of continuous time event history analysis in different fields of social science applications, this book demonstrates that event history models provide a useful approach to uncover causal relationships or to map a system of causal relationships. In particular, this book demonstrates how long term processes can be studied, how different forms of duration dependencies can be estimated using nonparametric, parametric, and semiparametric models, and how parallel and interdependent dynamic systems can be analyzed from a causal analytical point of view using the method of episode splitting. The book also shows how changing contextual information at the micro, meso, and macro levels can be easily integrated into a dynamic analysis of longitudinal data. Finally, the book addresses the problem of unobserved heterogeneity of time constant and time dependent omitted variables and makes suggestions for dealing with these sometimes difficult methodological problems.

Causal Analysis with Event History Data Using Stata is an invaluable resource for both novice and experienced researchers from a variety of fields, e.g., sociology, economics, political science, education, psychology, demography, epidemiology, management research, and organizational studies, as well as medicine and clinical applications who need an introductory textbook on continuous time event history analysis and who are looking for a practical handbook for their longitudinal research.

Advanced Survival Models Catherine Legrand, 2021-03-22

Survival data analysis is a very broad field of statistics encompassing a large variety of methods used in a wide range of applications and in particular in medical research. During the last twenty years, several extensions of classical survival models have been developed to address particular situations often encountered in practice. This book aims to gather in a single reference the most commonly used extensions such as frailty models in case of unobserved heterogeneity or clustered data, cure models when a fraction of the population will not experience the event of interest, competing risk models in case of different types of event, and joint survival models for a time to event endpoint and a longitudinal outcome. Features: Presents state of the art approaches for different advanced survival models including frailty models, cure models, competing risk models, and joint models for a longitudinal and a survival outcome. Uses consistent notation throughout the book for the different techniques presented. Explains in which situation each of these models should be used and how they are linked to specific research questions. Focuses on the understanding of the models, their implementation, and their interpretation with an appropriate level of methodological development for masters students and applied statisticians. Provides references to

existing R packages and SAS procedure or macros and illustrates the use of the main ones on real datasets This book is primarily aimed at applied statisticians and graduate students of statistics and biostatistics It can also serve as an introductory reference for methodological researchers interested in the main extensions of classical survival analysis
