The report considers the characteristics and interfaces of vehicle wheels and rail tracks and wheel gauges, rail sections, alignments, speeds, and track moduli. The report includes chapters on vehicles, alignment, track structures, track components, special track work, aerial structures, bridges, corrosion control, noise, and vibration, signals, traction power, and the integration of LRT track into urban streets.

Precast Concrete Railway Track Systems fib Fédération internationale du béton, 2006-01-01. In 1986 the FIP Commission on Prefabrication issued the state of art report *Concrete Railway Sleepers* which included design considerations, manufacturing methods, rail fastening systems, and field performance. During the two decades since that report, precast concrete has gained importance in the field of railway track systems for plain track, switches and crossings, tunnels, and other applications. Developments in production methods for concrete sleepers in switch and crossing layouts to cope with the complex geometry and the industry's confidence in their performance have contributed to the huge increase in the use of this type of sleeper. The use of slab track for high speed track has also grown particularly where either new track is built or where existing track is renewed and long periods of track possession are possible. There has also been progress in the development of plant and equipment for the installation, renewal, and maintenance of concrete sleepered track. With machines now able to replace existing track at a rate of 5000 sleepers over 3 km track per day, choosing concrete sleepers can reduce the time on site, meaning tracks can be reopened quickly whilst reducing labour requirements and costs. Today precast concrete is considered to be the best performing and preferred material for railway sleepers due to the following factors: long term durability, improved geometric retention of track, and greater weight vital for high speed and heavy freight lines, improved elasticity of track, improved ride quality, low first cost, minimum life cycle cost, low cost of maintenance, environmental friendliness, no chemical treatment required, and can be recycled. As all aspects of precast concrete railway track systems from design through manufacture to installation and maintenance have progressed since the publication of the FIP report, an update was considered timely in order to provide a synthesis of currently available information. This new edition covers quality, design, production, durability, maintenance, and environmental considerations and includes survey on the use of precast concrete track systems in over 30 countries.
