Best Practices For Dust Control In Metal/nonmetal Mining:

Best Practices for Dust Control in Metal/nonmetal Mining Jay Colinet, 2010 Best Practices for Dust Control in Metal/Nonmetal Mining Jay F. Colinet, Andrew B. Cecala, Gregory J. Chekan, John A. Organiscak, Anita L. Wolfe, 2013-10-25

This handbook was developed to identify available engineering controls that can assist the industry in reducing worker exposure to respirable silica dust. The intent is to identify the best practices that are available for controlling respirable dust level in underground and surface metal nonmetal mining operations. This handbook provides general information on the control technologies along with extensive references.

Best Practices for Dust Control in Metal/Nonmetal Mining

Department of Health and Human Services, Centers for Disease Control and Prevention, National Institute Safety and Health, 2013-10

Respirable silica dust exposure has long been known to be a serious health threat to workers in many industries. Overexposure to respirable silica dust can lead to the development of silicosis, a lung disease that can be disabling and fatal in its most severe form. Once contracted, there is no cure for silicosis, so the goal must be to prevent development by limiting a worker's exposure to respirable silica dust. In addition, the International Agency for Research on Cancer (IARC) has concluded that there is sufficient evidence to classify silica as a human carcinogen. For workers in the metal nonmetal mining industry, the Mine Safety and Health Administration (MSHA) regulates and monitors exposure to respirable silica dust through personal dust sampling. Recent MSHA personal sampling results indicate that overexposures to respirable silica dust continue to occur for miners in metal nonmetal mining operations. From 2004 to 2008, the percentages of samples that exceeded the applicable respirable dust standard for the different mining commodities were 12% for sand and gravel, 13% for stone, 18% for nonmetal, and 21% for metal. Of the 2,407 deaths attributed to silicosis in the United States from 1990-1999, employment information was available for 881 deaths. Metal nonmetal mining was the industry recorded for over 15% of these 881 deaths, with mining machine operator the most frequently recorded occupation. In light of ongoing silica overexposures and reported silicosis deaths in metal nonmetal miners, an ongoing threat to miners' health is evident. This handbook was developed to identify available engineering controls that can assist the industry in reducing worker exposure to respirable silica dust. The controls discussed in this handbook range from long used controls which have developed into industry standards to newer controls which are still being optimized. The intent is to identify the best practices that are available for controlling respirable dust levels in underground and surface metal nonmetal mining operations. This handbook provides general information on the control technologies along with extensive references. In some cases, the full reference will need to be accessed to gain in-depth information on the testing or implementation of the control of interest.
