Alternative Respiratory Pathways in Higher Plants Kapuganti Jagadis Gupta, Luis A. J. Mur, Bhagyalakshmi Neelwarne, 2015-05-07 Rapid developments in molecular and systems biology techniques have allowed researchers to unravel many new mechanisms through which plant cells switch over to alternative respiratory pathways This book is a unique compendium of how and why higher plants evolved alternative respiratory metabolism It offers a comprehensive review of current research in the biochemistry physiology classification and regulation of plant alternative respiratory pathways from alternative oxidase diversity to functional marker development The resource provides a broad range of perspectives on the applications of plant respiratory physiology and suggests brand new areas of research Other key features written by an international team of reputed plant physiologists known for their pioneering contributions to the knowledge of regular and alternative respiratory metabolism in higher plants includes step by step protocols for key molecular and imaging techniques advises on regulatory options for managing crop yields food quality and environment for crop improvement and enhanced food security covers special pathways which are of key relevance in agriculture particularly in plant post harvest commodities Primarily for plant physiologists and plant biologists this authoritative compendium will also be of great value to postdoctoral researchers working on plant respiration as well as to graduate and postgraduate students and university staff in Plant Science It is a useful resource for corporate and private firms involved in developing functional markers for breeding programs and controlling respiration for the prevention of post harvest losses in fruit vegetables cut flowers and tubers

Crop Response to Waterlogging Iduna Arduini, Makie Kokubun, Guangcheng Shao, Francesco Licausi, 2020-01-03 Target Sites of Herbicide Action Peter Boger, Gerhard Sandmann, 2020-11-25 This publication is based on the plant processes and reaction sites for

which reliable knowledge on both their physiology and biochemistry and the mode of herbicidal action is available. Targets of the agrochemical research such as enzymes of biosynthetic pathways or herbicide binding peptides in the photosynthetic membrane are highlighted. Detailed knowledge about the target sites will allow biochemical model systems to evaluate the biological activity of newly synthesized compounds before their conventional screening in the greenhouse. Quantitative structure activity relationships should be performed more reliably with simple biological species or enzymology assays to aid in the rational design of pesticides. This text is highly valuable for plant physiologists, pathologists and chemists in the agrochemical industry and universities.

Mitochondria in Higher Plants Roland Douce, 2012-12-02 Mitochondria in Higher Plants: Structure, Function and Biogenesis is a collection and interpretation of information on plant mitochondria. It explains not only the basic enzymology of ATP synthesis coupled to electron transport that seems to constitute the major activity of the mitochondria but also many other aspects that make plant mitochondria rather more diverse than their animal counterparts. Organized into five chapters, this book begins with the morphological and cytological observations on mitochondria and proceeding through membrane and matrix functions to participation in metabolism and biogenesis. Each section presents the unique properties of plant mitochondria within the framework of general mitochondrial structure and function. This book is intended not only for research workers and students interested in the enzymology of plant mitochondria respiration but also for graduate and undergraduate students in the field of plant biochemistry, cell physiology and molecular biology. It will be useful as a starting point for those students wishing to pursue special studies in this field.

Programmed Cell Death in Higher Plants E. Lam, H. Fukuda, J. Greenberg, 2011-06-27 The molecular mechanisms which determine whether the cells of a multicellular organism will live or commit suicide have become a popular field of research in biology during the last decade. Cell death research in the plant field has also been expanding rapidly in the past 5 years. This special volume of Plant Molecular Biology seeks to bring together examples of a diverse array of experimental approaches in a single volume. From the differentiation of tracheary elements in vascular plants to the more specialized cell death model of the aleurone in cereals, this volume will bring the reader up to date with the characterization of different plant model systems that are currently being studied. This endeavor should complement general overviews of plant cell death mechanisms that have been published elsewhere by providing more detailed information on various aspects of this field to interested graduate students and more senior biologists alike.
