Adaptive Optics Edward Kibblewhite:

Adaptive Optics Engineering Handbook Robert Tyson, 1999-11-10 This handbook supplies analytical tools for the design and development of adaptive optics systems to enhance their ability to adjust for atmospheric turbulence optical fabrication errors thermally induced distortions and laser device aberrations It provides recommendations for selecting testing and installing a wavefront compensation system

Adaptive Optics Michael S. Tarov, 2002 Adaptive optics is a field which is coming into its own with new discoveries occurring almost daily both in astronomy and in applications of AO in applied fields In an adaptive optics system the output from a wavefront sensor is used to calculate corrections that actively remove distortions from an image The applications of adaptive optics in vision science have received considerable impetus from the knowledge developed by astronomers about how to correct images using AO technology It is expected that developments in adaptive optics will radically change the face of astronomy in the 21st century These systems will largely overcome the main limitation of ground based telescopes namely the severe reduction in image quality caused by turbulence in the Earth's atmosphere Intended for use at near infrared wavelengths adaptive optics allow imaging and spectroscopy at the limit of resolution imposed by optical diffraction an advance in astronomer's ability to view the heavens unparalleled since the invention of the telescope AO is now also entering clinical medicine in the field of ophthalmology and other related fields This new book presents several hundred current abstracts in the field each fully indexed for ease of access and contains a CD ROM for further research

Adaptive Optics Systems and Technology, 1999 *Adaptive Optics and Applications*, 1997 *Adaptive Optics for Large Telescopes*, 1992 Laser Guide Star Adaptive Optics for Astronomy N. Ageorges, C. Dainty, 2013-04-17 Adaptive optics allows the theoretical limit of angular resolution to be achieved from a large telescope despite the presence of turbulence Thus an eight meter class telescope such as one of the four in the Very Large Telescope operated by ESO in Chile will in future be routinely capable of an angular resolution of almost 0.01 arcsec compared to the present resolution of about 0.5 arcsec for conventional imaging in good condition All the world's major telescopes either have adaptive optics or are in the process of building AO systems It turns out that a reasonable fraction of the sky can be observed using adaptive optics with moderately good imaging quality provided imaging is done in the near IR To move out of the near IR with its relatively poor angular resolution astronomers need a laser guide star There is a layer of Na atoms at approximately 90 km altitude that can be excited by a laser to produce such a source or Rayleigh scattering can be employed lower in the atmosphere But the production and use of laser guide stars is not trivial and the key issues determining their successful implementation are discussed here including the physics of the Na atom the cone effect tilt determination sky coverage and numerous potential astronomical applications
