

your cells use ATP energy to perform 3 main types of work:

Living cells use up ATP at a very fast rate - a human cell needs about 2 million a second. In order to maintain constant levels, a supply of ATP must be replaced as it is used. So, it is constantly being recycled in your cells.

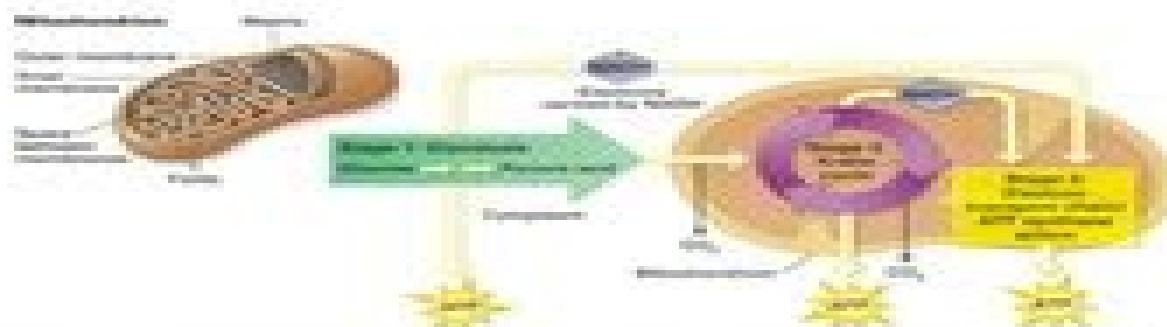

How do we recycle ATP? your cells need oxygen and glucose? Where do they get oxygen by breaking down glucose the by-product of cellular respiration (CO<sub>2</sub>) by breathing out?

In cellular respiration, the atoms in glucose and oxygen are rearranged, forming 2 carbon dioxide molecules. The cell uses the energy released to produce ATP. This process takes several steps.

Cellular respiration has three main stages (some minor stages). Two of the three take place in the mitochondria. This is a "road map" of all three stages.
