

**CHAPTER 34****The Biosphere****Summary of Key Concepts**

**Concept 34.1** The biosphere is the global ecosystem. (pp. 744–749)

The scientific study of the interactions among organisms and between organisms and their environments is called ecology. Ecologists study the relationships among biotic and abiotic factors. All the living organisms in the environment are called biotic factors. The nonliving physical and chemical conditions are called abiotic factors. Ecologists conduct studies at five increasingly larger levels: individual organisms, populations, communities, ecosystems, and the biosphere. A population is a group of organisms of the same species living in a particular area. A community is made up of all of the organisms living in a particular area. An ecosystem is made up of the abiotic factors and the biotic factors in an area. The biosphere includes all of Earth's ecosystems.

The biosphere is “patchy”—a particular area may contain an uneven distribution of different ecosystems. This patchiness creates different habitats, or specific environments in which organisms live. Each habitat has characteristic abiotic and biotic factors. Abiotic factors that define different habitats include amount of sunlight, availability of water, temperature, soil type, wind, and number and type of disturbances. Major natural disturbances that affect ecosystems include fires, hurricanes, tornadoes, and volcanic eruptions.

1. What are the five levels of ecological study? \_\_\_\_\_  
individual organisms, populations, communities, ecosystems, and the biosphere.
2. What are habitats, and what creates habitats? \_\_\_\_\_  
specific environments where organisms live.
3. Distinguish biotic factors from abiotic factors. \_\_\_\_\_  
Living organisms in the environment are the biotic factors while the nonliving ones are the abiotic.

**Concept 34.2** Climate determines global patterns in the biosphere. (pp. 750–752)

The climate of a region mostly determines the type of ecosystem found there. Earth's climate is mainly produced by the uneven heating of Earth by the sun. Different locations on Earth's surface receive different amounts of solar energy. As a result, Earth's surface can be divided into different temperature zones based on lines of latitude. The region that lies between 23.5° N latitude and 23.5° S latitude, called the tropics, is the warmest temperature zone. The region north of the Arctic Circle and the region south of the Antarctic Circle, called the polar zones, are the coldest temperature zones. The latitudes between the tropics and the polar zones, called the temperate zones, experience less extreme heat and cold.

The uneven heating of Earth's surface also affects global patterns of winds and precipitation. Warm air is warmed it can absorb more moisture, and it tends to rise. The rising and falling of air masses, combined with
