1. An SRP binds to the signal peptide, halting synthesis momentarily.

2. The SRP binds to a receptor protein in the ER membrane. This receptor is part of a protein complex (a translocation complex) that has a membrane pore and a signal-cleaving enzyme.

3. The SRP leaves, and polypeptide synthesis resumes, with simultaneous translocation across the membrane. (The signal peptide stays attached to the translocation complex.)

4. The signal-cleaving enzyme cuts off the signal peptide.

5. The rest of the completed polypeptide leaves the ribosome and folds into its final conformation.
