BIOMES

Take a closer look at the images above. Each is home to a variety of plants and animals, but no two are the same. Although they're all capable to life, there are quite a lot of differences too. Many of these differences are **abiotic**, or have to do with the non-living parts of the environment. Abiotic factors include temperature, the amount of oxygen in the air or water, and the kind of soil present.

infer, or make your best guess, about some of the abiotic factors in each of the images.

Location	Temperature	Amount of rainfall
A

C		

Specifying these locations are all home to many trees, or living, factors as well. What kinds of species do you think live in each of these places? Find five in plants, animals, birds, fish, insects, and even microscopic life like bacteria!

Chaparral

Tundra

Lastly, the **chapparral** biome is a coastal biome with hot, dry summers and mild winters. It has mostly shrubs with a few short trees. Deer, birds, and rabbits live in the chapparral.

Tundra When we think of deserts, we usually think of a hot and dry place, but did you know that deserts can be cold too? The **Tundra** in Alaska is the largest cold desert, but there is so much snow (and) that it's still considered a desert. Both plants and animals must adapt to dry life in the desert. Many develop unique ways of surviving such as water storage.

extremely nutrient rich soil. Here you'll find a variety of plants and animals. Due to their dry and hot climate, plants in both savanna and grasslands are adapted to survive relatively common fires.

Desert When we think of deserts, we usually think of a hot and dry place, but did you know that deserts can be cold too? The **Desert** in Alaska is the largest cold desert, but there is so much snow (and) that it's still considered a desert. Both plants and animals must adapt to dry life in the desert. Many develop unique ways of surviving such as water storage or the ability to remain dormant (similar to hibernation) for a long time.

Forest There are several different kinds of forest biomes, including: The **rainforest** is most likely the most famous forest. This lush forest is home to a vast number of plants and animals. It's also home to a large number of people. The **temperate forest** is common in the US, Canada, Europe, and Asia. Here you'll find a variety of plants and animals. The **deciduous forest** is common in the US, Canada, Europe, and Asia. Here you'll find a variety of plants and animals. The **coniferous forest** is common in the US, Canada, Europe, and Asia. Here you'll find a variety of plants and animals.

BIOMES

Earth is an amazing planet. It has many different environments that make perfect homes for millions of species. The largest major habitats that exist worldwide are known as **biomes**. Most likely, you're familiar with many of these: desert, rainforest, grassland, etc. Each biome is unique and has its own set of characteristics that make it different from the others. One of the most important factors in determining a biome is the amount of water it receives. This is why biomes are so diverse and unique.

How many biomes are there? Do all water environments constitute a single aquatic biome? Are all fire-filled ecosystems considered a forest biome? The number of biomes you could find simply depends on how specific you'd like to be. Let's take a look at some of the largest biomes, and the abiotic and biotic factors that define them.

Marine

Freshwater

Savanna

For fish, birds, frogs, whales, and other aquatic species. **Aquatic Biomes** Since water covers over 70% of the Earth, the largest biomes are the aquatic biomes. Marine biomes include coral reefs and estuaries, but the two major ones are the marine and freshwater biomes. The **marine** biome, made up of the world's oceans, is so big it's usually divided into smaller biomes. Estuaries, for example, are a unique type of biome. The **freshwater** biome, made up of lakes, ponds, and rivers, is also a unique type of biome. Both biomes are home to a vast number of species. The **marine** biome is home to many of the world's largest animals, including whales, dolphins, and many types of fish. The **freshwater** biome is home to many types of fish, including salmon, trout, and many types of smaller fish. Both biomes are also home to many types of plants, including seaweed and many types of freshwater plants.

Grassland Grassland biomes live up to their name! They're made up of open and very few trees. The two major grassland biomes are the **savanna** and **temperate grassland**. The **savanna** is a type of grassland that covers much of Africa and large parts of Australia. These areas have a wet season in the summer and a dry season in the winter. The **temperate grassland** is a type of grassland that covers much of the central US and parts of Europe. These areas have a wet season in the summer and a dry season in the winter. Both biomes are home to many types of animals, including elephants, zebras, and many types of smaller animals. Both biomes are also home to many types of plants, including grasses and many types of shrubs and trees.

The **temperate grasslands**, on the other hand, make up the plains of middle America. They're home to many types of animals, including bison, cattle, and many types of smaller animals. They're also home to many types of plants, including grasses and many types of shrubs and trees. Both biomes are also home to many types of insects, including beetles, ants, and many types of smaller insects.

Answer the following questions using the world map.

1. What is a biome?
2. Is weather a biotic factor or an abiotic factor? How do you know?
