

Chapter 44: Osmoregulation and Excretion

1. Define these two terms.

osmoregulation: The general term for the processes by which animals control solute concentrations and balance water gain and loss.

excretion: The process that rids the body of nitrogenous metabolites and other metabolic waste products.

LO 44.1: Summarize the osmotic challenges facing animals living in marine, freshwater, and terrestrial habitats.

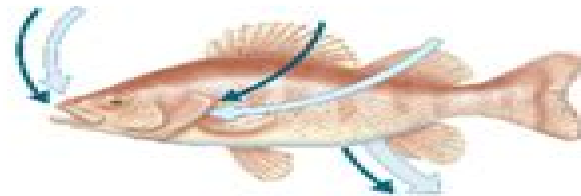

2. When two solutions separated by a membrane differ in osmolarity, in which direction does water flow?

When two solutions differ in osmolarity, the one with the greater concentration of solutes is said to be hyperosmotic, and the more dilute solution is said to be hypoosmotic. Water flows from a hypoosmotic solution to a hyperosmotic one.

3. An animal can maintain water balance in two ways. Explain the difference between *osmoconformers* and *osmoregulators*.

An osmoconformer is isoosmotic with its surroundings; an osmoregulator controls internal osmolarity independent of that of its environment.

4. Use Figure 44.3 in your text to label and explain *osmoregulation* in saltwater (marine) and freshwater fish.
