The Future of Foods

Maria G. Corradini, Tatiana Koutchma, Noemi Elisabet Zaritzky, Isabel Sousa, 2025-09-10 The future of food can take many avenues of exploration from the product itself such as unusual sources like grass microalgae acorns and so on to by products from the food industry e g fruit pomaces and brewer spent grains to disruptive technologies from data management and integration e g digital twins to processing e g additive manufacturing precision fermentations cell ag When considering the future of food sometimes this is more accurately seen as the cycle of food Development is continual but sometimes to address the future we must look historically for example a resurgence in pulses for protein or the increase in shelf stable foods due to the Covid 19 pandemic The future of food requires many considerations such as life cycle assessment customization social impact environmental impact and economic impact In particular when developing new foods with sustainability in mind eg alternative proteins one has to take into account the health benefits as well as indulgence and sensory appeal and these factors must be weighed against the financial cost of the production processes and the ultimate cost to the consumer

Algal Conditions and the Potential for Future Algal Problems in the Willamette River, Oregon David A. Rickert, 1977 For nearly half a century the Willamette River in Oregon experienced severe dissolved oxygen problems related to large loads of organically rich waste waters from industries and municipalities Since the mid 1950 s dissolved oxygen quality has gradually improved owing to low flow augmentation the achievement of basinwide secondary treatment and the use of other waste management practices As a result summer dissolved oxygen levels have increased salmon runs have returned and the overall effort is widely regarded as a singular water quality success To document the improved dissolved oxygen regimen the U S Geological Survey conducted intensive studies of the Willamette during the summer low flow seasons of 1973 and 1974 During each summer the mean daily dissolved oxygen levels were found to be higher than 5 milligrams per liter throughout

the river Because of the basinwide secondary treatment carbonaceous deoxygenation rates were low In addition almost half of the biochemical oxygen demand entering the Willamette was from diffuse nonpoint sources rather than outfalls These results indicated that point source biochemical oxygen demand was no longer the primary cause of dissolved oxygen depletion Instead the major causes of deoxygenation were nitrification in a shallow surface active reach below Salem and an anomalous oxygen demand believed to be primarily of benthal origin in Portland Harbor
