Archives Manual ,2005 A High-Rate Virtual Instrument of Marine Vehicle Motions for Underwater Navigation and Ocean
Remote Sensing Chrystel Gelin,2012-08-22 Dead Reckoning aided with Doppler velocity measurement has been the most
common method for underwater navigation for small vehicles Unfortunately DR requires frequent position recalibrations and
underwater vehicle navigation systems are limited to periodic position update when they surface Finally standard Global
Positioning System GPS receivers are unable to provide the rate or precision required when used on a small vessel To
overcome this a low cost high rate motion measurement system for an Unmanned Surface Vehicle USV with underwater and
oceanographic purposes is proposed The proposed onboard system for the USV consists of an Inertial Measurement Unit
IMU with accelerometers and rate gyros a GPS receiver a flux gate compass a roll and tilt sensor and an ADCP Interfacing all
the sensors proved rather challenging because of their different characteristics The proposed data fusion technique
integrates the sensors and develops an embeddable software package using real time data fusion methods for a USV to aid in
navigation and control as well as controlling an onboard Acoustic Doppler Current Profiler ADCP While ADCPs non
intrusively measure water flow the vessel motion needs to be removed to analyze the data and the system developed provides
the motion measurements and processing to accomplish this task
