Drawing on the expertise of leading herpetologists and wildlife biologists, the report offers important insights into the ecological dynamics of the region and provides valuable information for conservation and management efforts. Whether you're a biologist, conservationist, or nature enthusiast, this report is an indispensable reference for understanding the diversity and complexity of Montana's wildlife. Montana Amphibian and Reptile Distribution, 1994 **State and Provincial Amphibian and Reptile Publications for the United States and Canada** John J. Moriarty, Aaron M. Bauer, 2000

Bibliography of herpetofaunal literature through Dec 31 1999, limited to published papers and books that deal primarily with single states or provinces or substantial portions thereof **Herpetology in Montana**, 2003 **State-wide Assessment of Status, Predicted Distribution, and Landscape-level Habitat Suitability of Amphibians and Reptiles in Montana** Bryce Alan Maxell, 2009

Beginning in the late 1980s, herpetologists began to realize that amphibians around the world had undergone and were continuing to undergo declines, extirpations, and extinctions. In most cases, detections of declines and determinations of the underlying causes have been hampered by a lack of available baseline information on distribution and status. This project was a cooperative effort to address these data deficiencies for amphibians and reptiles in Montana. Watersheds with greater than 30 percent federal or state land ownership were randomly selected for survey in each of 11 geographic strata. Visual encounter and dipnet surveys of all standing water bodies on public lands within these watersheds yielded watershed and site occupancy estimates as a measure of status. Occupancy estimates from this first ever state-wide base level assessment can be more validly used for future comparisons with future status assessment, provided additional support for declines in Western Toad (*Bufo boreas*) and Northern Leopard Frog (*Rana pipiens*) populations in western Montana and identified a variety of conservation issues of concern that can be addressed through management actions, e.g., clear evidence for negative impacts of fish and importance of maintaining natural disturbance regimes such as flooding, beaver, and

fire The information gathered during field inventories was combined with other existing information and used in maximum entropy modeling to predict state wide distribution and habitat suitability for all of Montana s amphibians and reptiles These models out performed GAP analysis models by simultaneously reducing the area predicted and omission error rates Among other things models identified scale dependent responses to environmental variables potentially isolated populations in need of conservation efforts and areas that are critical for maintaining landscape connectivity In conjunction with field inventories a state wide assessment of the distribution of the pathogenic chytrid fungus *Batrachochytrium dendrobatidis* Bd was undertaken using PCR based detection in skin swabs or tissue samples Bd was found across Montana in 6 of the 9 species tested at a variety of elevations habitats and distances from human activities The widespread presence of Bd highlights the need for additional studies and measures to prevent the spread of Bd and other novel pathogens
