

Chiral pool synthesis

- Chiral pool synthesis is one of the simplest and oldest approaches for enantioselective synthesis. A readily available chiral starting material is manipulated through successive reactions, often using achiral reagents, to obtain the desired target molecule. This can meet the criteria for enantioselective synthesis when a new chiral species is created, such as in an [S_N2 reaction](#).

- Chiral pool synthesis is especially attractive for target molecules having similar chirality to a relatively inexpensive naturally occurring building-block such as a sugar or [amino acid](#). However, the number of possible reactions the molecule can undergo is restricted and tortuous synthetic routes may be required (e.g. [Oseltamivir total synthesis](#)). This approach also requires a [stoichiometric](#) amount of the [enantiopure](#) starting material, which can be expensive if it is not naturally occurring.
