

Mission: Providing hands-on experience to students to use instrumentation specific to biomedical engineering and properly interpret measurements from living systems.

Students utilize Bioinstrumentation Lab equipment to investigate bioelectric signals and conduct innovative research projects.

Biopac Student Lab system is used to display, record, and analyze various physiology signals

- Heart signals (ECG),
- Brain waves (EEG)
- Muscle activity (EMG),
- Nerve Conduction
- Respiratory and Pulmonary Function

Students use various sensors and actuators such as strain gauges, temperature sensors, and Piezoelectric buzzers with open-source microcontrollers such as Arduino.

Medical applications for circuit design such as diagnostic measurements, biosensors, and wearable devices are studied.

Understanding Bioinstrumentation M. Prakash, 2009 Bioinstrumentation John Denis Enderle, 2006 This short book provides basic information about bioinstrumentation and electric circuit theory Many biomedical instruments use a transducer or sensor to convert a signal created by the body into an electric signal Our goal here is to develop expertise in electric circuit theory applied to bioinstrumentation We begin with a description of variables used in circuit theory charge current voltage power and energy Next Kirchhoff's current and voltage laws are introduced followed by resistance simplifications of resistive circuits and voltage and current calculations Circuit analysis techniques are then presented followed by inductance and capacitance and solutions of circuits using the differential equation method Finally the operational amplifier and time varying signals are introduced This lecture is written for a student or researcher or engineer who has completed the first two years of an engineering program i e 3 semesters of calculus and differential equations A considerable effort has been made to develop the theory in a logical manner developing special mathematical skills as needed At the end of the short book is a wide selection of problems ranging from simple to complex NASA Contributions to Bioinstrumentation Systems Spacelabs, Inc, 1968 Bioinstrumentation John Enderle, 2022-06-01 This short book provides basic information about bioinstrumentation and electric circuit theory Many biomedical instruments use a transducer or sensor to convert a signal created by the body into an electric signal Our goal here is to develop expertise in electric circuit theory applied to bioinstrumentation We begin with a description of variables used in circuit theory charge current voltage power and energy Next Kirchhoff's current and voltage laws are introduced followed by resistance simplifications of resistive circuits and voltage and current calculations Circuit analysis techniques are then presented followed by inductance and capacitance and solutions of circuits using the differential equation method Finally the operational amplifier and time varying signals are introduced This lecture is written for a student or researcher or engineer who has completed the first two years of an engineering program i e 3 semesters of calculus and differential equations A considerable effort has been made to develop the theory in a logical manner developing special mathematical skills as needed At the end of the short book is a wide selection of problems ranging from simple to complex **Bioinstrumentation** John G. Introduction to Bioinstrumentation Clifford D. Ferris,1978 The present volume is designed as a practical tutorial survey not only for all those interested in bioinstrumentation and its applications but also as a text for a one semester upper division undergraduate course in instrumentation for bioengineering students A knowledge of basic physics basic electronics and mathematics to elementary linear differential equations is assumed The book is well suited for use as a reference source for all research and clinical workers in the fields of biology medicine and the environmental sciences who have an adequate background in the physical sciences At the University of Wyoming the text is also used for a course in the interdisciplinary program for graduate study in the neurosciences The philosophy espoused herein is fundamental system analysis and design rather than detailed discussion of particular devices produced by commercial manufacturers Equipment oriented texts although initially useful tend to become obsolete rather rapidly Basic design and analysis techniques change little with time Discussion has been limited to devices that have found applications in the biological environmental and medical fields Many transducers used in other disciplines have been omitted It is not the author's intent to produce a compendium of transducer applications but rather an introduction to those techniques used in the environmental biological and medical sciences
