Preface

The molecules that make up the living cell continue to excite great interest. The methods available for investigating these molecules have improved dramatically in the last decade. Some of the most powerful new techniques involve the application of electromagnetic radiation. These techniques include various magnetic resonance and visible spectra, which detect transitions between energy levels, and others such as microscopy, scattering, and diffraction. In this book the term spectroscopy is used to cover all these methods. The close relationships among these topics are readily emphasized in textbooks; the reading level is often either too superficial or too detailed for most readers. This book tries to bring out the recurring concepts in this field and to show a course between the specialist text and the introductory.

Our overall aim is to lead undergraduates, graduate students, and other readers to an appreciation of the current literature. Many people find the concepts involved in spectroscopy rather difficult, so our approach here is to use worked examples and problems to emphasize important points and to illustrate biological applications rather than complex mathematical derivations. Most chapters in this text deal with one particular technique and can thus be read independently of other chapters, but we have also included a central chapter on concepts and definitions and various appendices designed to give more information on difficult points.

We owe thanks to many people who have given advice and read chapters of the manuscript. Among these we should mention D. Ashford, P. Atkins, J. Boyd, S. Eamesbrook-Smith, Z. Lu, M. Moody, R. Parikh, J. Pao, S. Pringle, R. Potts, T. W. Radomacher, W. G. Richards, J. Seelig, R. J. Simpson, B. Simon, and A. Watts. We also thank D. Koslow, S. Hoelt, and F. Cuddeback for their skilful work on the diagrams.
