

Types of relationship that may exist among organism.

1. Predator / Prey
2. Exchange of gas (CO_2 & O_2) among plants and animals.
3. Mutualism

Discussion: Green plants are called producers because they are the only one that trap sunlight used to make energy. This energy is the only source of energy for living organisms. Animals that feed on plants are called herbivores animals that feed on other animals are called carnivores and animals that feed on both plant and animals are called omnivores. A food chain shows the flow of energy from plants to animals and from animals to other animals. A food web shows the feeding relationship between all the organisms in the ecosystem. A trophic level of an organism is the position it occupies on the food chain. It indicates the number of organisms between the feeder and the sun. A trophic level doesn't normally go beyond five (5) trophic levels because the energy is continually being used up from one organism to the next therefore there would be no energy left to be pass on. The most energy was concentrated in the producer or the 1st trophic level because this is where the energy has been first converted from the sun into energy as food. The least energy was concentrated at the 5th trophic level because as the energy is being passed on it is being used up by other organisms therefore the energy level decreases.

Conclusion: it can be concluded that there are relationships that exist among living organisms in the ecosystem and these relationships link them to help with their survival.
