Abstract: The authors examined the effects of a 12-week, low-intensity, supervised walking program on the physical and psychological health of sedentary, middle-aged women. The program was designed to be a safe, enjoyable, and accessible form of physical activity. The results showed that the program had a positive effect on the women's physical and psychological health. The authors concluded that a supervised walking program is a safe and effective way to improve the health of sedentary, middle-aged women.

1. **Explain the difference between a point estimate and a confidence interval.**
A point estimate is a single value that serves as an estimate of a population parameter. A confidence interval is a range of values that is likely to contain the true value of the population parameter.
2. **Describe the Central Limit Theorem and its importance in statistics.**
The Central Limit Theorem states that the distribution of sample means will approach a normal distribution as the sample size increases, regardless of the shape of the population distribution.
3. **Define the standard error of the mean and explain how it is calculated.**
The standard error of the mean (SEM) is the standard deviation of the sampling distribution of the sample mean. It is calculated as the population standard deviation divided by the square root of the sample size.
4. **Explain the difference between a z-test and a t-test.**
A z-test is used when the population standard deviation is known and the sample size is large. A t-test is used when the population standard deviation is unknown and the sample size is small.
5. **Describe the concept of statistical significance and how it is determined.**
Statistical significance is the probability that the results of a study are not due to chance. It is determined by comparing the p-value to a predetermined significance level (alpha).
6. **Explain the difference between a one-tailed test and a two-tailed test.**
A one-tailed test is used when the researcher is interested in a specific direction of effect. A two-tailed test is used when the researcher is interested in any effect, regardless of direction.
7. **Define the concept of a confidence interval and explain how it is constructed.**
A confidence interval is a range of values that is likely to contain the true value of the population parameter. It is constructed by adding and subtracting a critical value (z or t) multiplied by the standard error of the mean from the point estimate.
8. **Explain the difference between a parametric test and a non-parametric test.**
Parametric tests assume that the data follows a normal distribution and that the variances are equal. Non-parametric tests do not make these assumptions.
9. **Describe the concept of a p-value and explain how it is interpreted.**
The p-value is the probability of obtaining a result as extreme as the one observed, assuming that the null hypothesis is true. A small p-value indicates that the results are statistically significant.
10. **Explain the difference between a null hypothesis and an alternative hypothesis.**
The null hypothesis (H0) is the statement that there is no effect or no difference. The alternative hypothesis (H1) is the statement that there is an effect or a difference.
11. **Define the concept of a Type I error and explain how it is controlled.**
A Type I error is the probability of rejecting the null hypothesis when it is actually true. It is controlled by setting a significance level (alpha).
12. **Explain the difference between a Type II error and a Type I error.**
A Type II error is the probability of failing to reject the null hypothesis when it is actually false. It is controlled by increasing the sample size and the power of the test.
