Designing Human-centred Technology Howard H. Rosenbrock, 2012-12-06 This second book in our series Artificial Intelligence and Society explores the issues involved in the design and application of human centred systems in the manufacturing area At first glance it may appear that a book on this topic is somewhat peripheral to the main concerns of the series In fact although starting from an engineering perspective the book addresses some of the pivotal issues confronting those who apply new technology in general and artificial intelligence AI systems in particular Above all the book invites us to consider whether the present applications of technology are such as to make the best use of human skill and ingenuity and at the same time provide for realistic and economically sustainable systems design solutions To do so it is necessary to provide systems which support the skill and are amenable to the cultures of the areas of application in question In a philosophical sense it means providing tools to support skills rather than machines which replace them to use Heidegger s distinction The book gives an authoritative account of the University of Manchester Institute of Science and Technology UMIST tradition of human centredness and provides a participatory design approach which focuses on collaborative learning and enhancement and creation of new skills It also argues that collaboration should be supported by institutions through the creation of supportive infrastructures and research environments It emphasises the optimisation of practical knowledge with the help of scientific knowledge and rejects the alternative
