Marquis, J. Solin, 1999-02-19 This volume represents a selection of papers presented at the Third International Symposium on Fatigue Design Fatigue Design 1998 held in Espoo Finland 26-29 May 1998 One objective of this symposium series was to help bridge the gap that sometimes exists between researchers and engineers responsible for designing components against fatigue failure The 21 selected papers provide an up to date survey of engineering practice and a preview of design methods that are advancing toward application Reliability was selected as a key theme for FD 98 During the design of components and structures it is not sufficient to combine mean material properties average usage parameters and pre selected safety

factors The engineer must also consider potential scatter in material properties different end users manufacturing tolerances and uncertainties in fatigue damage models Judgement must also be made about the consequences of potential failure and the required degree of reliability for the structure or component during its service life Approaches to ensuring reliability may vary greatly depending on the structure being designed Papers in this volume intentionally provide a multidisciplinary perspective on the issue Authors represent the ground vehicle heavy equipment power generation ship building and other industries Identical solutions cannot be used in all cases because design methods must always provide a balance between accuracy and simplicity The point of balance will shift depending on the type of input data available and the component being considered

Consideration of runouts by the evaluation of fatigue experiments Toasa Caiza, Paul Dario, 2019-05-27 In EC3 the fatigue life of a steel structure subjected to a cyclic load is estimated by its detail category This category is based on the S-N curves which are obtained by applying the Basquin model Statistically this model does not allow extrapolating the S-N curves in the HCF region neither does it consider the runouts This affects the fatigue life estimation when a structure bears loading in HCF To overcome these deficiencies a new method based on a Weibull distribution is applied
