

R20 OS LAB MANUAL

1. Practicing of Basic UNIX Commands.

Files (command -- description)

ls --- lists your files

ls -l --- lists your files in 'long format', which contains lots of useful information, e.g. the exact size of the file, who owns the file and who has the right to look at it, and when it was last modified.

ls -a --- lists all files, including the ones whose filenames begin in a dot, which you do not always want to see.

There are many more options, for example to list files by size, by date, recursively etc.

cp filename1 filename2 --- copies a file

rm filename --- removes a file. It is wise to use the option **rm -i**, which will ask you for confirmation before actually deleting anything. You can make this your default by making an [alias](#) in your **.cshrc** file.

diff filename1 filename2 --- compares files, and shows where they differ

wc filename --- tells you how many lines, words, and characters there are in a file

chmod options filename --- lets you change the read, write, and execute permissions on your files. The default is that only you can look at them and change them, but you may sometimes want to change these permissions. For example, **chmod o+r filename** will make the file readable for everyone, and **chmod o-r filename** will make it unreadable for others again. Note that for someone to be able to actually look at the file the directories it is in need to be at least executable. See [help.protection](#) for more details.

Directories (command -- description)

Directories, like folders on a Macintosh, are used to group files together in a hierarchical structure.

mkdir dirname --- make a new directory
