Asymptotics beyond All Orders Harvey Segur, Saleh Tanveer, Herbert J. Levine, 2012-12-06 An asymptotic expansion is a series that provides a sequence of increasingly accurate approximations to a function in a particular limit The formal definition given by Poincare 1886 Acta Math 8 295 is as follows Given a function

Interfacial Wave Theory of Pattern Formation in Solidification Jian-Jun Xu, 2017-05-23 This comprehensive work explores interfacial instability and pattern formation in dynamic systems away from the equilibrium state in solidification and crystal growth Further this significantly expanded 2nd edition introduces and reviews the progress made during the last two decades In particular it describes the most prominent pattern formation phenomena commonly observed in material processing and crystal growth in the framework of the previously established interfacial wave theory including free dendritic growth from undercooled melt cellular growth and eutectic growth in directional solidification as well as viscous fingering in Hele Shaw flow It elucidates the key problems systematically derives their mathematical solutions by pursuing a unified asymptotic approach and finally carefully examines these results by comparing them with the available experimental results The asymptotic approach described here will be useful for the investigation of pattern formation phenomena occurring in a much broader class of inhomogeneous dynamical systems In addition the results on global stability and selection mechanisms of pattern formation will be of particular interest to researchers working on material processing and crystal growth The stability mechanisms of a curved front and the pattern formation have been fundamental subjects in the areas of condensed matter physics materials science crystal growth and fluid mechanics for some time now This book offers a stimulating and insightful introduction for all physicists engineers and applied mathematicians working in the fields of soft condensed matter physics materials science mechanical and chemical engineering fluid dynamics and nonlinear sciences

Chaos, Order, and Patterns Roberto Artuso, P. Cvitanovic, Giulio Casati, 2012-12-06 Proceedings of a NATO ASI held in Lake Como Italy June 25 July 6 1990

Interfacial Wave Theory of Pattern Formation Jian-Jun Xu, 2012-12-06 For the last several years the study of interfacial instability and pattern formation phenomena has preoccupied many researchers in the broad area of nonlinear science These phenomena occur in a variety of dynamical systems far from equilibrium In many practically very important physical systems some fascinating patterns are always displayed at the interface between solid and liquid or between two liquids Two prototypes of these phenomena are dendrite growth in solidification and viscous fingering in a Hele Shaw cell These two phenomena occur in completely different scientific fields but both are described by similar nonlinear free boundary problems of partial differential equation systems the boundary conditions on the interface for both cases contain a curvature operator involving the surface tension which is nonlinear Moreover both cases raise the same challenging theoretical issues interfacial instability mechanisms and pattern selection and it is now found that these issues can be solved by the same analytical approach Thus these two phenomena are regarded as special examples of a class of nonlinear pattern

formation phenomena in nature and they are the prominent topics of the new interdisciplinary field of nonlinear science This research monograph is based on a series of lectures I have given at McGill University Canada 1993 1994 Northwestern Poly technical Institute China 1994 Aachen University Germany 1994 and the CRM summer school at Banff Alberta Canada 1995

Painlevé Transcendents Decio Levi, Pavel Winternitz, 2013-11-11 The NATO Advanced Research Workshop Painlevé Transcendents their Asymptotics and Physical Applications held at the Alpine Inn in Sainte Adele near Montreal September 27 1990 brought together a group of experts to discuss the topic and produce this volume There were 41 participants from 14 countries and 27 lectures were presented all included in this volume The speakers presented reviews of topics to which they themselves have made important contributions and also results of new original research The result is a volume which though multiauthored has the character of a monograph on a single topic This is the theory of nonlinear ordinary differential equations the solutions of which have no movable singularities other than poles and the extension of this theory to partial differential equations For short we shall call such systems equations with the Painlevé property The search for such equations was a very topical mathematical problem in the 19th century Early work concentrated on first order differential equations One of Painlevé's important contributions in this field was to develop simple methods applicable to higher order equations In particular these methods made possible a complete analysis of the equation $f(y)y' = x$ where f is a rational function of y and y' with coefficients that are analytic in x The fundamental result due to Painlevé *Acta Math*

Low-Dimensional Structures in Semiconductors A.R. Peaker, H.G. Grimmeiss, 2013-06-29 This volume contains a sequence of reviews presented at the NATO Advanced Study Institute on Low Dimensional Structures in Semiconductors from Basic Physics to Applications This was part of the International School of Materials Science and 1990 at the Ettore Majorana Centre in Sicily Technology held in July Only a few years ago Low Dimensional Structures was an esoteric concept but now it is apparent they are likely to play a major role in the next generation of electronic devices The theme of the School acknowledged this rapidly developing maturity The contributions to the volume consider not only the essential physics but take a wider view of the topic starting from material growth and processing then progressing right through to applications with some discussion of the likely use of low dimensional devices in systems The papers are arranged into four sections the first of which deals with basic concepts of semiconductor and low dimensional systems The second section is on growth and fabrication reviewing MBE and MOVPE methods and discussing the achievements and limitations of techniques to reduce structures into the realms of one and zero dimensions The third section covers the crucial issue of interfaces while the final section deals with devices and device physics

Orthogonal Polynomials and Special Functions Erik Koelink, Walter Van Assche, 2003-07-03 The set of lectures from the Summer School held in Leuven in 2002 provide an up to date account of recent developments in orthogonal polynomials and special functions in particular for algorithms for computer algebra packages 3n symbols in representation theory of Lie groups enumeration multivariable special functions and Dunkl

operators asymptotics via the Riemann Hilbert method exponential asymptotics and the Stokes phenomenon Thenbsp volume aims at graduate students and post docs working in the field of orthogonal polynomials and special functions and in related fields interacting with orthogonal polynomials such as combinatorics computer algebra asymptotics representation theory harmonic analysis differential equations physics The lectures are self contained requiring onlynbsp a basic knowledge of analysis and algebra and each includes many exercises

Mathematical Research in Materials Science National Research Council, Division on Engineering and Physical Sciences, Commission on Physical Sciences, Mathematics, and Applications, Committee on Mathematical Sciences Applied to Materials Science, 1993-02-01 This book describes fruitful past collaborations between the mathematical and materials sciences and indicates future challenges It seeks both to encourage mathematical sciences research that will complement vital research in materials science and to raise awareness of the value of quantitative methods The volume encourages both communities to increase cross disciplinary collaborations emphasizing that each has much to gain from such an increase and it presents recommendations for facilitating such work This book is written for both mathematical and materials science researchers interested in advancing research at this interface for federal and state agency representatives interested in encouraging such collaborations and for anyone wanting information on how such cross disciplinary collaborative efforts can be accomplished successfully

Highlights in Condensed Matter Physics and Future Prospects Leo Esaki, 2013-11-27 This volume contains the proceedings of the first NATO Science Forum Highlights of the Eighties and Future Prospects in Condensed Matter Physics sponsored by the NATO Scientific Affairs Division which took place in September 1990 in the pleasant surroundings provided by the Hotel du Palais at Biarritz France One hundred distinguished physicists from seventeen countries including six Nobellaureates were invited to participate in the four and a half day meeting Focusing on three evolving frontiers semiconductor quantum structures including the subject of the quantum Hall effect QHE high temperature superconductivity HiTc and scanning tunneling microscopy STM the Forum provided an opportunity to evaluate in depth each of the frontiers by reviewing the progress made during the last few years and more importantly exploring their implications for the future Though serious scientists are not prophets all of the participants showed a strong interest in this unique format and addressed the questions of future prospects either by extrapolating from what has been known or by a stretch of their educated imagination
