

ARCHITECTURAL ACOUSTICS IN BUILDING DESIGN

A building is designed to control sound, by amplifying or reducing noise levels where necessary.

HOW SOUND TRAVELS

- 1 REFLECTION**
Sound hits a surface and bounces back off of it.
- 2 ABSORPTION**
Sound hits a surface and some of it is absorbed.
- 3 TRANSMISSION**
Sound that isn't absorbed or reflected passes through the material, such as a wall.

WHAT IMPACTS SOUND ABSORPTION?

MATERIALS

Soft and porous materials absorb more sound.

Fiberglass absorbs the most sound.

Concrete absorbs the least sound.

OTHER FACTORS

Higher levels of humidity result in more sound absorption.

Denser structures absorb higher sound frequencies than less dense structures.

Applied Architectural Acoustics Michael Rettinger, 1947 Architectural acoustics is not purely functional It combines the scientific with the artistic It provides the architect with forms and treatment of high esthetic appeal Today it is no longer necessary to copy buildings of reputedly good hearing conditions it is no longer necessary to be tradition bound Great flexibility exists in achieving identical results by dissimilar methods a flexibility which will become greater still as new acoustic materials are developed and novel methods of construction invented This book is directed to architects engineers contractors and all those connected with the planning and the construction of buildings in which acoustics has been given preference It is not a text book for colleges It is not fundamentally analytical A handbook for the man in the field it was kept practical without however shunning important theoretical matters In this book special attention is given to the acoustics of rooms in which sound is either recorded such as motion picture studios or broadcasting stations or is reproduced electrically such as motion picture theaters or monitoring rooms
