

varied by pressing a string against the fingerboard with the fingers to change the length L of the vibrating portion of the string. Increasing the tension F increases the wave speed v and thus increases the frequency (and the pitch). All string instruments are “tuned” to the correct frequencies by varying the tension; you tighten the string to raise the pitch. Finally, increasing the mass per unit length μ decreases the wave speed and thus the frequency. The lower notes on a steel guitar are produced by thicker strings, and one reason for winding the bass strings of a piano with wire is to obtain the desired low frequency from a relatively short string.

Wind instruments such as saxophones and trombones also have normal modes. As for stringed instruments, the frequencies of these normal modes determine the pitch of the musical tones that these instruments produce. We’ll discuss

EXAMPLE 15.10 Standing waves on a string

A string is stretched between two supports that are 1.20 m apart. The string is set into vibration in its third harmonic, and the frequency of the vibration is 420 Hz. (a) What is the wave speed on the string? (b) What is the tension in the string if the mass per unit length is 1.8 g/m?

IDENTIFY and SET UP

For a string fixed at both ends, the length of the string is equal to an integer number of half-wavelengths. The frequency of the vibration is the same as the frequency of the wave. We can use the relationship between wave speed, frequency, and wavelength to find the wave speed. We can also use the relationship between wave speed, tension, and mass per unit length to find the tension.

SOLVE

(a) The length of the string is 1.20 m. The string is set into vibration in its third harmonic, so the length of the string is equal to three half-wavelengths:

(b) The tension in the string is related to the wave speed by the equation

$$v = \sqrt{\frac{F}{\mu}} \quad \text{Equation 15.26}$$

$$F = \mu v^2 \quad \text{Equation 15.26}$$

where μ is the mass per unit length of the string. We can use this equation to find the tension in the string.

$$F = \mu v^2 = (1.8 \text{ g/m}) (336 \text{ m/s})^2 = 200 \text{ N}$$

$$F = \mu v^2 = (1.8 \text{ g/m}) (336 \text{ m/s})^2 = 200 \text{ N}$$

REMARK The wave speed on a string is not the same as the speed of sound in air. The wave speed on a string is determined by the tension in the string and the mass per unit length of the string. The speed of sound in air is determined by the properties of the air.

EXAMPLE 15.11 Standing waves on a string fixed at one end and free at the other

A string is stretched between two supports that are 1.20 m apart. The string is set into vibration in its third harmonic, and the frequency of the vibration is 420 Hz. (a) What is the wave speed on the string? (b) What is the tension in the string if the mass per unit length is 1.8 g/m?

IDENTIFY and SET UP

For a string fixed at one end and free at the other, the length of the string is equal to an odd number of quarter-wavelengths. The frequency of the vibration is the same as the frequency of the wave. We can use the relationship between wave speed, frequency, and wavelength to find the wave speed. We can also use the relationship between wave speed, tension, and mass per unit length to find the tension.

SOLVE

$$v = \sqrt{\frac{F}{\mu}} \quad \text{Equation 15.26}$$

REMARK The wave speed on a string is not the same as the speed of sound in air. The wave speed on a string is determined by the tension in the string and the mass per unit length of the string. The speed of sound in air is determined by the properties of the air.

Now Work PROBLEM 47 of Chapter 15. The wave speed on a string is not the same as the speed of sound in air. The wave speed on a string is determined by the tension in the string and the mass per unit length of the string. The speed of sound in air is determined by the properties of the air.
