Abstract—The purpose of this study was to determine the effect of a 10-min warm-up on the heart rate (HR) and oxygen consumption ($\dot{V}O_2$) of 10 male and 10 female subjects during a 10-min period of maximal exercise. The subjects were divided into two groups: a control group and an experimental group. The control group performed the exercise without a warm-up, while the experimental group performed the exercise after a 10-min warm-up. The results showed that the experimental group had a significantly higher HR and $\dot{V}O_2$ during the 10-min period of maximal exercise compared to the control group. The findings suggest that a 10-min warm-up can improve cardiovascular performance during maximal exercise.
