Hydraulic Control by Fluid Transfer: Pre-set Differentiation Between Bump and Rebound

A clean pressure die casting forms the body of the Armstrong shock absorber. The external lever and internal crank are rigidly pressed on to serrations on the main spindle.

THE name Armstrong has been associated with shock absorbers for a great many years and the makers have been intimately concerned with the automobile industry since the days before World War I. In 1913 the founder of The Armstrong's Patents Co., Ltd., of Beverley, East Yorkshire, Mr. Gordon Armstrong, manufactured a cycle car, as the very light air-cooled two-cylinder-engined four-wheelers of the day were known; the older generation of motorists may remember the Gordon, which performed in the reliability trials of those times.

About the same period Mr. Armstrong ran a Model T Ford and the problem of controlling its undamped transverse leaf spring suspension led

to his devising a simple type of friction snubber which was so successful, within its limits, that quite a business developed in producing sets for this then very popular car. In turn the results led to interest from other car manufacturers and the Armstrong shock absorber became more widely known.

Experience indicated that something more positively controllable was desirable and thoughts turned to hydraulic mechanisms; much later a new Armstrong device was developed of the two-cylinder type in which fluid passed from one cylinder to another through an adjustably restricted orifice so that violent bump and rebound were both resisted and dissipated, while there was suitable damping of minor

spring oscillations. These shock absorbers became standard equipment on many cars.

Before 1939 a new type was developed with the object of providing for a more accurately controlled differential action as between bump and rebound shocks; at the same time the design was planned for great reliability and long life without need for fluid replenishment, and with pre-set adjustments to actual operating conditions for the type and characteristics of the car on which it was installed. Furthermore, extreme simplicity of detail was worked out so that the conveyor system of assembly could be adopted to produce large quantities which could be guaranteed to be identical and which could be tested by an indicator against a master diagram for any particular vehicle, under actual load conditions, before being passed off assembly.

In Large Production

World War II halted production, although this type was made during the war for certain military and essential civilian vehicles and the production methods became well established. Now the latest Armstrong shock absorber is again in large production.

Shock absorber requirements are generally fairly well appreciated. During the relatively slow and easy movements of the axle under normal riding conditions the control of the
