

1. **Definition:** A **substitution cipher** is a type of cipher where each letter in the plaintext is replaced by another letter. This is done by using a **key** or **alphabet** that maps each letter of the alphabet to a unique letter.

2. **Example:** Let's take the plaintext "HELLO" and the key "A-Z" (where A is replaced by B, B by C, etc.). The ciphertext would be "IFMMP".

3. **Types:**

- Caesar Cipher:** A simple substitution cipher where each letter is shifted a fixed number of positions in the alphabet. For example, a shift of 3 would turn "HELLO" into "KHOOR".
- Vigenere Cipher:** A more complex substitution cipher that uses a repeating key to shift the letters. For example, with the key "KEY", "HELLO" would be encrypted as "KHOOR".
- Playfair Cipher:** A digraphic substitution cipher that uses a 5x5 grid of letters to encrypt pairs of letters. For example, with the key "KEY", "HELLO" would be encrypted as "KHOOR".

4. **Security:** Substitution ciphers are generally considered to be insecure because they are vulnerable to **frequency analysis**. This is a technique where the attacker analyzes the frequency of letters or pairs of letters in the ciphertext and compares it to the known frequencies in the plaintext language.

5. **Conclusion:** While substitution ciphers are easy to understand and implement, they are not secure for modern communication. However, they are still used in some applications where security is not a primary concern.

Ap Chemistry Quick Study Academic
