Blind Source Separation Using Frequency Independent Component Analysis:

Blind Source Separation Using Frequency Independent Component Analysis Gozie Okwelume, Anayo K.

Ezeude, 2010-07 The need for speech enhancement is very important because of the acoustic environment we are living in which is composed of noise and other atmospheric disturbances and this makes it almost impossible to record a speech signal in pure form. In most of the mixed signals there is usually no information about each source. In such a situation, the estimates of the original source signals are done based on the information of the received mixed signals; therefore, the approach to be adopted in such cases to separate the signals must be one that does it blindly. Thus, the method Blind Source Separation is used in this work. Our thesis work focuses on Frequency domain Blind Source Separation (BSS) in which the received mixed signals are converted into the frequency domain and Independent Component Analysis (ICA) is applied at each frequency bin. Our main target in this project is to solve the permutation and scaling ambiguities in real time applications using the method proposed by Minje et al. in [12]. Our results show that this method works better in offline mixtures than in real time and lastly, we gave some suggestions to improve the results. *Handbook of Blind Source Separation* Pierre Comon, Christian

Jutten, 2010-02-17 Edited by the people who were forerunners in creating the field together with contributions from 34 leading international experts, this handbook provides the definitive reference on Blind Source Separation, giving a broad and comprehensive description of all the core principles and methods, numerical algorithms and major applications in the fields of telecommunications, biomedical engineering and audio/acoustic and speech processing. Going beyond a machine learning perspective, the book reflects recent results in signal processing and numerical analysis and includes topics such as optimization criteria, mathematical tools, the design of numerical algorithms, convolutive mixtures and time-frequency approaches. This Handbook is an ideal reference for university researchers. *Robust algebraic identification of underdetermined mixtures: time-frequency methods* Bayesian approaches, blind identification under non-negativity, approaches, semi-blind methods for communications. Shows the applications of the methods to key application areas such as telecommunications, biomedical engineering, speech/acoustic audio and music processing, while also giving a general method for developing applications.

Independent Component Analysis and Blind Signal Separation Carlos G. Puntonet, 2004-09-17 In many situations found both in Nature and in human-built systems, a set of mixed signals is observed frequently, also with noise and it is of great scientific and technological relevance to be able to isolate or separate them so that the information in each of the signals can be utilized. Blind source separation (BSS) research is one of the more interesting emerging fields nowadays in the field of signal processing. It deals with the algorithms that allow the recovery of the original sources from a set of mixtures only. The adjective blind is applied because the purpose is to estimate the original sources without any a priori knowledge about either the sources or the mixing system. Most of the models employed in BSS assume the hypothesis about the independence of the original sources. Under this hypothesis, a BSS problem can be considered as a particular case of

independent component analysis ICA a linear transformation technique that starting from a multivariate representation of the data minimizes the statistical dependence between the components of the representation. It can be claimed that most of the advances in ICA have been motivated by the search for solutions to the BSS problem and the other way around. Advances in ICA have been immediately applied to BSS. ICA and BSS algorithms start from a mixture model whose parameters are estimated from the observed mixtures. Separation is achieved by applying the inverse mixture model to the observed signals separating or unmixing model. Mixture models usually fall into three broad categories: instantaneous linear models, convolutive models, and nonlinear models, the first being the simplest but in general not near realistic applications. The development and test of the algorithms can be accomplished through synthetic data or with real world data. Obviously the most important aim and most difficult is the separation of real world mixtures. BSS and ICA have strong relations also apart from signal processing with other fields such as statistics and artificial neural networks. As long as we can find a system that emits signals propagated through a medium and those signals are received by a set of sensors and there is an interest in recovering the original sources we have a potential field of application for BSS and ICA. Inside that wider range of applications we can find for instance noise reduction applications, biomedical applications, audio systems, telecommunications, and many others. This volume comes out just 20 years after the first contributions in ICA and BSS [1] appeared. Thereafter the number of research groups working in ICA and BSS has been constantly growing so that nowadays we can estimate that far more than 100 groups are researching in these fields. As proof of their recognition among the scientific community of ICA and BSS developments there have been numerous special sessions and special issues in several well known journals: *Journal of Herault, B. Ans, Circuits, neuronaux, synapses, modifiables, d'encodage de messages, c'oposites para apprentissage non supervise, C. R. de l'Académie des Sciences*, vol. 299, no. III, 13 pp, 525-528, 1984. *Independent Component Analysis and Signal Separation* Tulay Adali, Christian Jutten, Joao Marcos Travassos Romano, Allan Kardec Barros, 2009-02-25. This book constitutes the refereed proceedings of the 8th International Conference on Independent Component Analysis and Signal Separation ICA 2009 held in Paraty, Brazil, in March 2009. The 97 revised papers presented were carefully reviewed and selected from 137 submissions. The papers are organized in topical sections on theory, algorithms, and architectures, biomedical applications, image processing, speech and audio processing, other applications, as well as a special session on evaluation. **Independent Component Analysis and Signal Separation** Mike E. Davies, Christopher C. James, Samer A. Abdallah, Mark D. Plumbley, 2007-08-28. This book constitutes the refereed proceedings of the 7th International Conference on Independent Component Analysis and Blind Source Separation ICA 2007 held in London, UK, in September 2007. It covers algorithms and architectures, applications, medical applications, speech and signal processing, theory, and visual and sensory processing. *Blind Source Separation* Ganesh R.
