

Biology Exam 1 Study Guide

Lecture 1 → Introduction to Biological Science

Tree of Life

- Domains
 - Eukarya → visible life
 - Split into animals and plants
 - Very small portion
 - Bacteria → single cell
 - Make up most of life's branches
 - Symbionts that evolved into mitochondria and chloroplasts were eubacteria
 - Archaea → original domain of life
 - More closely related to eukaryotes than eubacteria, first branch of life
 - Basic split between archaea and bacteria
- Candidate phyla radiation: Single species have been identified, each identifies an entire phylum which is yet to be understood - pioneer species (tree is dominated by new species that scientists have never seen before)
- Species disappearing faster than can be recovered
- Eukaryotes and archaea are most closely related branches

Destruction and Mass Extinction

- One million species face imminent extinction because of humans
- Recent past → >50% vertebrates/>75% flying insects lost in the past <50 years
- Critically threatened → >40% amphibians, >30% plants/corals/sharks, >25% mammals
- Populations and extinctions have increased

Theory of Evolution

- Evolution: all life on earth evolved from a common ancestor, most properties within cells work in the same way, the change in gene distribution over time within a population
- Theory: a very well substantiated idea that explains many overlapping phenomena at once, wide-ranging, strongest. Not a hypothesis
- Darwin: species arise through random mutation and natural selection for fitness
- Evidence (fewer than 40% of Americans believe in evolution)
 - fossil record shows conservation of homologous structures
 - Molecular proof: same DNA and RNA protein in cells
 - Homologous function in hands and fins → evolved similar mechanisms in appendages
- Scopes Monkey Trial
 - Scopes taught evolution illegally; resulted in Butler Act → forbid teaching evolution in TN
- Endosymbiont theory
 - Single composite cell of greater complexity could evolve from two or more separate simpler living cells in a symbiotic relationship

Year of Earth's History

- 1 Jan: earth formed 4.54 bya by acceleration of material from the solar nebula via gravitational collapse, conditions were incompatible with life, bombarded with asteroid-sized meteors for 800 million years
- 4 Mar: by 3.8 bya bombardment had slowed, Earth had cooled to lower the temps "compatible" with life

Root systems biology Wolfgang Schmidt, 2014-10-03 The understanding of biological complexity has been greatly facilitated by cross disciplinary holistic approaches that allow insights into the function and regulation of biological processes that cannot be captured by dissecting them into their individual components In addition the development of novel tools has dramatically increased our ability to interrogate information at the nucleic acid protein and metabolite level The integration and interpretation of disparate data sets however still remain a major challenge in systems biology Roots provide an excellent model for studying physiological developmental and metabolic processes The availability of genetic resources along with sequenced genomes has allowed important discoveries in root biochemistry development and function Roots are transparent allowing optical investigation of gene activity in individual cells and experimental manipulation In addition the predictable fate of cells emerging from the root meristem and the continuous development of roots throughout the life of the plant which permits simultaneous observation of different developmental stages provide ideal premises for the analysis of growth and differentiation Moreover a genetically fixed cellular organization allows for studying the utilization of positional information and other non cell autonomous phenomena which are of utmost importance in plant development Although their ontogeny is largely invariant under standardized experimental conditions roots possess an extraordinary capacity to respond to a plethora of environmental

signals resulting in distinct phenotypic readouts This high phenotypic plasticity allows research into acclimative and adaptive strategies the understanding of which is crucial for germplasm enhancement and crop improvement With the aim of providing a current snapshot on the function and development of roots at the systems level this Research Topic collated original research articles methods articles reviews mini reviews and perspective opinion and hypotheses articles that communicate breakthroughs in root biology as well as recent advances in research technologies and data analysis
