

Cell Biology: Osmoregulation notes

Osmoregulation: Osmoregulation allows cells to maintain **homeostasis**. Osmotic pressure is a binding property that depends on the total amount of all impermeable and permeable solutes. **Water** diffuses through the semipermeable membrane in the direction of higher solute concentration.

For a **dilute** ideal solution: $\Pi = R \cdot T \cdot \Delta C$ 1 osmole [osmol] = 1 mole of solute. hypotonic arrangement of the cell - the extracellular arrangement is **exceptionally** weakened relative to the inside of the cell, causing the cell to grow and explode.

Hypertonic Arrangement - The extracellular arrangement is highly focused compared to the intracellular one, with the intracellular fluid moving out of the cell, thus creating the cell. Primary Dynamic Vehicle ("pumps"):

- **Movement** against the attachment gradient requires energy **Sodium (Na⁺)** angle of intracellular to extracellular fluid **Potassium (K⁺)** angle of intracellular to extracellular fluid Energy from food turns ADP into P ATP;
- **Secondary active transport: Sodium** from outside the cell (extracellular fluid) moves along its concentration gradient. It is divided into two types:
- **Anti Carriers (Control - Transport)** - when Na falls along the fixed slope in the cytosol, Ca or H moves from the inside of the cell (cytosol) to the extracellular fluid. **Sensors (Co - Transport)** - when Na lowers the focal **angle** into the cytosol (inside the cell), it receives glucose or an amino acid, particle channels and particle siphons (for example, the Na/K siphon) form the layer potential ion, channels (passive);
