Resources Toolbox Leif Wolf, Brian Morris, Stewart Burn, 2007-01-19 Holistic but applicable approaches are urgently needed to help plan long term cost effective and sustainable urban water management systems Groundwater is a central element in the urban water cycle of all cities located on aquifers yet it remains inadequately integrated into urban water management practices This book describes holistic approaches for quantification and balancing of urban water and solute fluxes that have been developed by the joint Euro Australian research project AISUWRS The new tools comprise a chain of interconnected models that link urban water supply urban drainage and urban groundwater resources These include a new sewer exfiltration model that is based on pipe asset conditions which permits flows to the environment to be estimated The book provides details on the further processing of this information through the unsaturated zone down to aquifer where numerical groundwater flow and transport models are applied Concise documentation is provided on each of the models The practicability of applying the chain of models was tested by applying it in four case study cities in Australia Germany Slovenia and the United Kingdom that have diverse conditions in terms of hydrogeologic setup climate and data availability This permitted additional validation by field investigations including problem oriented monitoring campaigns aimed at assessing the impact of wastewater practice on groundwater The book provides guidance and examples of the application of multilevel piezometers on adapted monitoring strategies and the use for interpretation purposes of microbiological parameters pharmaceutical residues and related marker species The socio economic analysis in the case study cities sometimes uncovered distinctively different problem perceptions and priorities both in the groups of experts responsible for the water

management and with the remaining stakeholders The AISUWRS project has developed tools to foster these urgently required deliberation processes Methodologies for formal sustainability assessment with a triple bottom line background were also elaborated and tested during the case studies The case studies have shown that the approach is valid and constitutes an important step towards integrated urban water management [Rainwater Harvesting—Building a Water Smart City](#) Aysha Akter,2022-03-11 This book introduces the readers to possible aspects of the rainwater harvesting system against urbanization to plan design and implement Practical applications of rainwater harvesting to supplement potable water stormwater management greywater reuse and managed aquifer recharge are included Along with conventional practices advanced technologies for conceptualizing data collection and processing test procedures and design principles are provided to illustrate the theory This book is a pathway to a water smart city example problems reflect the solutions for harvested water quantity and or quality and afterward Socio economic assessments are incorporated to explore comprehensive knowledge The book covers an interdisciplinary field thus suitable for students researchers and professionals associated with rainwater harvesting system development and management **Rainwater Tank Systems for Urban Water Supply** Ashok K. Sharma,Donald Begbie,Ted Gardner,2015-05-15 Rainwater tank systems have been widely adopted across the world to provide a safe local source of water in underdeveloped rural areas a substitution for mains water for non potable end uses in water stressed urban areas as well as providing flooding control in monsoonal climates such as Korea or combined sewer systems such as Germany The importance of these systems in cities has grown as water managers seek to provide a range of decentralised solutions to supply constraints of current water supply systems whilst reducing the impact of urban development on the natural environment and increasing resilience to the impacts of climate change Rainwater tank systems are now often implemented under integrated urban water management IUWM and water sensitive urban design WSUD philosophies which take a holistic view of the urban water cycle Rainwater Tank Systems for Urban Water Supply is based on a comprehensive multi million dollar research program that was undertaken in South East Queensland SEQ Australia in response to the Millennium drought when the water supply level in the regions drinking water dams dropped to 17% in July 2007 and the area came close to running out of water In particular the book provides insights and detailed analysis of design modelling implementation operation energy usage economics management health risk social perceptions and implications for water quality quantity of roof water runoff The approaches and methodologies included in Rainwater Tank Systems for Urban Water Supply inform and validate research programs and provide insights on the expected performance and potential pitfalls of the adoption of rainwater tanks systems including actual harvested yield and resulting mains water savings optimal sizing for rainwater storages and roof collection systems expected water quality and implications for managing public health risks modelling tools available for decision support operation and management approaches of a decentralised asset at the household scale and community acceptance The book is suitable for use at
