INTRODUCTION Computer Networks A collection of autonomous computers interconnected by a single technology to facilitate data communication Two computers are said to be interconnected if they are able to exchange information The connection need not be via a copper wire fiber optics microwaves infrared and communication satellites can also be of used The computers are autonomous which are not forcibly started stopped or controlled by other one A system with one control unit and more than one slave is not a computer network Computer network consists of end systems or nodes which are capable of transmitting information and which communicate through a transit system interconnected them The transit system also called as interconnection subsystem or sub network The nodes in the computer network comprise the computer terminals software and peripherals forming an autonomous system capable of performing information processing End system has an interface or interaction through which it is physically connected with subnet The interaction point has an address by which end system is identified Each end system hosts one or more application entities by which the communication takes place between end systems The subnet performs all transmission and switching activities Transmission media connect end system and subnet and carry information **DATA COMMUNICATIONS AND COMPUTER NETWORKS, SECOND**

Resource Proportional Software Design for Emerging Systems Suparna Bhattacharya, Kanchi Gopinath, Doug Voigt, 2020-02-25 Efficiency is a crucial concern across computing systems from the edge to the cloud Paradoxically even as the latencies of bottleneck components such as storage and networks have dropped by up to four orders of magnitude software path lengths have progressively increased due to overhead from the very frameworks that have revolutionized the pace of information technology Such overhead can be severe enough to overshadow the benefits from switching to new technologies like persistent memory and low latency interconnects *Resource Proportional Software Design for Emerging Systems* introduces resource proportional design RPD as a principled approach to software component and system development that counters the overhead of deeply layered code without removing flexibility or ease of development RPD makes resource consumption proportional to situational utility by adapting to diverse emerging needs and technology systems evolution Highlights Analysis of run time bloat in deep software stacks an under explored source of power performance wastage in IT systems Qualitative and quantitative treatment of key dimensions of resource proportionality Code features Unify and broaden supported but optional features without losing efficiency Technology and systems evolution Design software to adapt with changing trade offs as technology evolves Data processing Design systems to predict which subsets of data processed by an analytics or ML application are likely to be useful System wide trade offs Address interacting local and global considerations throughout software stacks and hardware including cross layer co design involving code data and systems dimensions and non functional requirements such as security and fault tolerance Written from a systems perspective to explore RPD principles best practices models and tools in the context of emerging technologies and applications This book is primarily geared towards practitioners with some advanced topics for researchers The principles shared in the book are expected to be useful for programmers engineers and researchers interested in ensuring software and systems are optimized for existing and next generation technologies The authors are from both industry Bhattacharya and Voigt and academic Gopinath backgrounds

Active and Programmable Networks for Adaptive Architectures and Services Syed Asad Hussain, 2006-12-15 Most conventional networks are passive with only basic traffic monitoring management routing and congestion control At best they can be called reactive Deploying new functions and integrating new

standards into these architectures is difficult due to the rigid embedding of software and hardware into the network components Active and Program

Wireless Communication in Underground Mines L. K. Bandyopadhyay, S. K. Chaulya, P. K. Mishra, 2009-08-29 Wireless communication has emerged as an independent discipline in the past decades Everything from cellular voice telephony to wireless data transmission using wireless sensor networks has profoundly impacted the safety production and productivity of industries and our lifestyle as well After a decade of exponential growth the wireless industry is one of the largest industries in the world Therefore it would be an injustice if the wireless communication is not explored for mining industry Underground mines which are characterized by their tough working conditions and hazardous environments require fool proof mine wide communication systems for smooth functioning of mine workings and ensuring better safety Proper and reliable communication systems not only save the machine breakdown time but also help in immediate passing of messages from the vicinity of underground working area to the surface for day to day normal mining operations as well as for speedy rescue operations in case of disaster Therefore a reliable and effective communication system is an essential requisite for safe working and maintaining requisite production and productivity of underground mines Most of the existing systems generally available in underground mines are based on line wired communication principle hence these are unable to withstand in the disaster conditions and difficult to deploy in inaccessible places Therefore wireless communication is an indispensable reliable and convenient system and essential in case of day to day normal duty or disaster situations
