Blow Moulding Technical Manual:

Practical Guide to Blow Moulding N. C. Lee, Norman C. Lee, 2006 Blow moulding is a manufacturing process used to form hollow plastic parts. It evolved from the ancient art of glass blowing and it is used to particular advantage with plastic materials. Celluloid was used first to blow mould baby rattles and novelties in the 1930s. Linear low density polyethylene was used in the 1940s for high production bottles and these days polyethylene terephthalate is used to make anything from soda bottles to highly sophisticated multilayered containers and automotive fuel tanks in the last decade. When designing a product it is important to consider aspects such as a material's characteristics, the processing methods available, the assembly and finishing procedures and the life cycle and expected performance of the product. This book presents the basics of blow moulding as well as the latest state of the art and science of the industry. A key feature is the approach of discussing the basics and then taking the reader through the entire process from design development through to final production.

Handbook of Industrial Polyethylene and Technology Mark A. Spalding, Ananda Chatterjee, 2017-10-26 This handbook provides an exhaustive description of polyethylene. The 50 chapters are written by some of the most experienced and prominent authors in the field providing a truly unique view of polyethylene. The book starts with a historical discussion on how low density polyethylene was discovered and how it provided unique opportunities in the early days. New catalysts are presented and show how they created an expansion in available products including linear low density polyethylene, high density polyethylene, copolymers and polyethylene produced from metallocene catalysts. With these different catalysts systems a wide range of structures are possible with an equally wide range of physical properties. Numerous types of additives are presented that include additives for the protection of the resin from the environment and processing fillers, processing aids, anti-fogging agents, pigments and flame retardants. Common processing methods including extrusion, blown film, cast film, injection molding and thermoforming are presented along with some of the more specialized processing techniques such as rotational molding, fiber processing, pipe extrusion, reactive extrusion, wire and cable and foaming processes. The business of polyethylene including markets, world capacity and future prospects are detailed. This handbook provides the most current and complete technology assessments and business practices for polyethylene resins.

Plastics Processing Data Handbook D.V. Rosato, 2012-12-06 This comprehensive book provides guidelines for maximizing plastics processing efficiency in the manufacture of all types of products using all types of plastics. A practical approach is employed to present fundamental yet comprehensive coverage of processing concepts. The information and data presented by the many tables and figures interrelate the different variables that affect injection molding, extrusion, blow molding, thermoforming, compression molding, reinforced plastics molding, rotational molding, reaction injection molding, coining, casting and other processes. The text presents a great number of problems pertaining to different phases of processing. Solutions are provided that will meet product performance requirements at the lowest cost. Many of the processing variables and their behaviors in

the different processes are the same as they all involve basic conditions of temperature time and pressure The book begins with information applicable to all processes on topics such as melt softening flow and controls all processes fit into an overall scheme that requires the interaction and proper control of systems Individual processes are reviewed to show the effects of changing different variables to meet the goal of zero defects The content is arranged to provide a natural progression from simple to complex situations which range from control of a single manual machine to simulation of sophisticated computerized processes that interface with many different processing functions
